 - 10 Approval of report**
- Annex 1: Detailed findings for Supply Base Evaluation indicators**

1 Overview

Producer name: Reginacork, SA

Producer address: Herdade Monte Novo 75, 2959-909 Pinhal Novo, Portugal

SBP Certificate Code: SBP-07-01

Geographic position: 38.657610, -8.919273

Primary contact: Sofia Cardoso, +351 212 361 406, florestal@reginacork.pt

Company website: www.reginacork.pt

Date report finalised: 15 Feb 2022

Close of last CB audit: 25 Feb 2022

Name of CB: NEPCon OÜ

SBP Standard(s) used: SBP Standard 1: Feedstock Compliance Standard, SBP Standard 2: Verification of SBP-compliant Feedstock, SBP Standard 4: Chain of Custody, SBP Standard 5: Collection and Communication of Data Instruction, Instruction Document 5E: Collection and Communication of Energy and Carbon Data 1.5

Weblink to Standard(s) used: <https://sbp-cert.org/documents/standards-documents/standards>

SBP Endorsed Regional Risk Assessment: Not applicable

Weblink to SBR on Company website: <http://www.reginacork.pt/wp-content/uploads/2021/06/Third-Surveillance-Audit.pdf>

2 Description of the Supply Base

2.1 General description

Feedstock types: Primary

Includes Supply Base evaluation (SBE): Yes

Feedstock origin (countries): Portugal

2.2 Description of countries included in the Supply Base

Country:Portugal

Area/Region: Continent

Exclusions: No

Reginacork, Biomass Producer, is a company located in Pinhal Novo in the centre-south of Portugal. Reginacork produces wood pellets, wood chips, and half-products out of cork (cork granules). The company's activities contribute to the regional economy and to effective forest fire fighting. Besides exporting SBP pellets for the energy market, Reginacork sells wood chips to companies locally and high-quality wood pellets to the residential market. Cork powder is a residue from Reginacork's own production of natural cork granules and is used as fuel for the drying process.

In 2021, the reference period, Reginacork has increased its wood pellets production capacity to 42.000 tonnes per year. Considering the amount of feedstock used of around 63.000 tonnes, Reginacork is less than a medium wood consumer when comparing to other wood pellet production units in the Supply Base. Of the distribution of consumption by sectors of the pine based industries, the bioenergy sector (biomass and pellets) represent 27%. The most relevant sector continues to be the sawmill, with 39%, followed by the production of pellets, with 22% (source: ICNF, 2021).

According to ICNF, 2021, pine wood consumption in 2020 was 4,1 Mm³, without bark, representing a decrease of 9,1% in relation to the previous year. In the wood pellets sector the decrease was 15% between 2019 and 2020. The pandemic context and its transversal impact on the economy should have contributed to this contraction. However, this decrease falls within the range of variation that has been registered in recent years, that is, it cannot be said that 2020 was an exceptional year. Pine wood deficit in 2020 was of 2,3 Mm³ (source: ICNF, *Sistema Simplificado de Cotações de Mercado dos Produtos Florestais*, 2021).

In 2021 Reginacork bought different kinds of feedstock to 28 primary wood suppliers: roundwood, low-grade tree stems, forest residues, and raw cork. Reginacork uses low grade roundwood for pellet production; saw logs are sold to sawmills. Reginacork works with primary wood suppliers and buys wood to forest owners (standing wood). When buying from forest owners, Reginacork subcontracts harvesting

teams to conduct the harvesting and wood chipping and/or executes forest operations with its own equipment and personnel. The harvesting teams mainly do maintenance and selective cuttings. The harvesting teams work at approximately six different land owners each per year. Of the 28 feedstock suppliers 7 are FSC® certified but not all deliver the feedstock with an FSC® claim. Reginacork is certified against the FSC Controlled Wood standard (FSC-STD-40-005) and evaluates incoming volumes accordingly. Natural cork from the cork oak (*Quercus suber*) comes from 154 (in 2021) suppliers in Continental Portugal.

Feedstock used by Reginacork for wood pellets production include the following tree species:

- Maritime pine (*Pinus pinaster*);
- Umbrella pine (*Pinus pinea*);
- Eucalyptus (*Eucalyptus spp.*);
- Acacia (*Acacia spp.*);
- Poplar (*Populus spp.*);
- Narrow-leafed ash (*Fraxinus angustifolia*).

In 2021 primary feedstock accounts for 100% of the total feedstock supply of Reginacork, of which 71,15% SBP-compliant primary feedstock (35,48% FSC® certified feedstock and 35,67% brought in under the SBE), and 28,85% SBP-controlled primary feedstock.

Although the supply base is Continental Portugal as a whole, Reginacork has sourced wood and cork from the following regions in the centre-south of the country: Lisbon, Setubal, Santarem, Evora, Beja, Portalegre. These regions are mainly composed of pine, oak and eucalyptus. In Portugal there are more than half of a million of forest owners and most of these own only one or two hectares of land. However, in the south of Portugal the size of the properties is larger.

According to the final report of last National Forest Inventory (IFN6) - 2015, the Portuguese Forest covers 3,2 million ha, it represents 69,4% of Portugal Mainland.

The soil use in Portugal Mainland (2015) correspond to:

36% - forest;

31% - pastures and bushes;

24% - farmland;

5% - urban use;

2% - inland waters;

2% - unproductive.

Forest occupation in Portugal Mainland (2015):

26% - *Eucalyptus spp.*;

22% - *Quercus suber*;

22% - *Pinus pinaster*;

6 % - *Pinus pinea*;

3% - *Quercus spp.*;

2% - *Castanea sativa*;

6% - Other hardwoods;

2% - Other softwoods.

In Portugal, around 97% of forest land is private (including individuals, communities, cooperatives and companies). The remaining 3% is public. Forest areas integrated in the National System of Conservation Areas represent 19% of the Portuguese mainland forest (IFN6). National forests and forest perimeters, under ICNF represent 6% of the forest. Typical distribution of the Forest private property on several regions of the Portuguese mainland (Coelho, Inocência):

- Trás-os-Montes, Douro e Minho regions show a property average size of 1,9 ha/owner, being 63% of properties with less than 10 ha.

- Beira Interior and Beira Litoral, in the central region of Portuguese mainland show a property average size of 1,46 ha/owner and properties under 10ha representing 62% of the forest area.

- Ribatejo and West: 7,53 ha/owner average and 55,6% of the forest properties above 100 ha.

- Alentejo: 22,6 ha/owner average and 68,8% of the forest properties above 100 ha.

- Algarve: 2,83 ha/owner and 59% of properties with less than 10 ha.

- The forest area under communitarian management (Baldios) are subject to old customary and traditional rights and regulated by specific laws. In Portugal, there are no indigenous peoples or specific minorities relying on the forests.

Some key aspects of forests in Portugal determine the development of its management, namely:

- A long and well-established relationship between forests and society.

- One of the biggest large-scale afforestation programs of the twentieth century (forest cover has increased from under 2,0 million to over 3,2 million ha over the last 100 years).
- Various regions with different forest species and silvicultural systems; specific forestry legislation directed towards regional development strategies.
- The small property size and its fragmentation, mainly in the northern and central regions, where properties often have dimensions of less than 1 hectare.
- Forest Management Plans (PGF) are mandatory for forest areas above a minimum area defined by Regional Forestry Management Plans (PROFs) as well as in Forest Intervention Areas (ZIF). In 2016, there were 1.680.000 ha under PGF from which 450.034 ha overlap the National Classified Areas Network.
- A felling manifest is required for commercial felling (including all thinning) of all tree species for industrial purposes, with a 30-day deadline after the operation is concluded.
- The national forest and conservation authority is the Institute of Conservation of Nature and Forests (ICNF) with competencies on all forest, hunting and nature conservation affairs. ICNF also manages public forest areas and is involved in the management of community areas. Additionally, the Environmental Service of the National Republican Guard (SEPNA / GNR) is engaged in the inspection of environmental issues and natural resources in all private and public areas.
- In Portugal getting in forest lands is not considered invasion even on private properties, and it is common the use of wild products by communities (mushrooms, asparagus, snails, besides fishing on public waters).
- The felling phytosanitary manifest includes identification of the origin of the felling. Also, documentation for transportation identifies the origin of the transport which could be useful in case of direct transport to Biomass Producer's facilities and in any case, is useful in the traceability of material. Both are the most common ways to trace back to origin even if the origin area is not the forest land itself but the smallest administrative division where forest land is included. However, there are still areas in Portugal without a cadastral system.
- Regarding species, published data in November 2018 by ICNF, the most relevant in terms of biomass production are maritime pine (*Pinus pinaster*): 23% of forest surface (714.000 ha), eucalyptus (*Eucalyptus spp.*): 26% of forest surface (812.000 ha) and stone or umbrella pine (*Pinus pinea*): 6% of forest surface (175.000 ha) (<http://www2.icnf.pt/portal/florestas/ppf/estatisticas-oficiais/resource/doc/ICNF-Perfil-Florestal-v08nov2018.pdf>). It is relevant to highlight that *Pinus pinea* is mainly used to produce pine nut and mostly the thinning and pruning by-products are used for wood pellets production. Stone or umbrella pine is mainly found in the south of the country. Maritime pine and eucalyptus are spread all over the country.
- To derive maximum economic benefit, distribution of the three main forest species – maritime pine, eucalyptus and cork oak – is vertically integrated within the forestry industry, with maritime pine and eucalyptus being concentrated in timber-producing areas and cork oak in multifunctional areas.

Regarding the main three tree species in Portugal:

- The maritime pine (*Pinus pinaster*), has rounded crown and grows up to 40 meters. It is scattered all over the regions of northern and central coast of the country. This has been the species chosen in the afforestation campaigns carried out during the nineteenth century, due to its ability to adapt to poor and rocky soil. In addition, it regenerates easily. Its timber is widely used commercially.
- Eucalyptus (*Eucalyptus globulus*), originally from Tasmania is present all over the country. These trees can grow up to 55 meters and grow rapidly. Especially used by pulp and paper industry, eucalyptus became one of the most planted trees in Portugal. In the 80's, there was great controversy about the negative

effects of these trees in soil, water and biodiversity, which resulted in the implementation of legislation (Law Nº. 175/88 of May 17 and Law Nº. 513/89, 6 July) that restricts the increase of monoculture plantation of this species.

- The cork oak (*Quercus suber*) is a tree with a rounded canopy up to 20 meters, which produces cork intensively. This is an evergreen indigenous species, typical of Mediterranean climate forests. Their presence can be found throughout the territory. Cork is a raw material with unique characteristics, the cork oak is the 'national tree' of Portugal. Portugal is the leading producer, processor and exporter of cork.

Typical forest management practices for pine species are clear cut with natural regeneration. For eucalyptus, the typical silvicultural model is coppice with re-planting after 3rd or 4th rotation. Other such as poplar, oaks etc. are incidental species which are reforested naturally.

The adjacent lands to Portugal are the country Spain, which has the same forest resources profile as Portugal.

CITES (Convention on International Trade in Endangered Species of Wild Fauna and Flora) does list a considerable number of protected plant species for Portugal, however, the list does not include any tree species.

<i>Antipathes erinaceus</i>	<i>Stichopathes dissimilis</i>	<i>Stichopathes richardi</i>
<i>Stichopathes robusta</i>	<i>Stichopathes setacea</i>	<i>Leiopathes expansa</i>
<i>Tanacetipathes cavernicola</i>	<i>Tanacetipathes squamosa</i>	<i>Tanacetipathes wirtzi</i>
<i>Paracyathus arcuatus</i>	<i>Leptopsammia formosa</i>	<i>Madracis profunda</i>
<i>Crypthelia medioatlantica</i>	<i>Crypthelia vascomarquesi</i>	<i>Errina atlantica</i>
<i>Errina dabneyi</i>	<i>Lepidopora eburnea</i>	<i>Euphorbia despoliata</i>
<i>Euphorbia longifolia</i>	<i>Euphorbia pedroi</i>	<i>Euphorbia piscatoria</i>
<i>Euphorbia stygiana</i>	<i>Dactylorhiza foliosa</i>	<i>Goodyera macrophylla</i>
<i>Orchis scopulorum</i>	<i>Platanthera micrantha</i>	

The 'Red List' of the IUCN (International Union for Conservation of Nature and Natural Resources) indicates hundreds of plant species for the continental territory of Portugal, but also does not include any tree species. 49 plant species are reckoned relevant regarding forest operations.

<i>Ammoides pusilla</i>	<i>Anarrhinum longipedicellatum</i>	<i>Andrena curtula</i>
-------------------------	-------------------------------------	------------------------

<i>Andrena fulva</i>	<i>Andrena gredana</i>	<i>Antirrhinum lopesianum</i>
<i>Arabis sadina</i>	<i>Aristolochia paucinervis</i>	<i>Armeria rouyana</i>
<i>Arnica montana</i>	<i>Asphodelus bento-rainhae</i>	<i>Bunium bulbocastanum</i>
<i>Calopteryx virgo</i>	<i>Candidula belemensis</i>	<i>Centaurea fraylensis</i>
<i>Clytus tropicus</i>	<i>Culcita macrocarpa</i>	<i>Dactylorhiza elata</i>
<i>Dianthus marizii</i>	<i>Elona quimperiana</i>	<i>Eryngium viviparum</i>
<i>Euphorbia transtagana</i>	<i>Festuca brigantina</i>	<i>Festuca summilusitana</i>
<i>Flavipanurgus granadensis</i>	<i>Flavipanurgus ibericus</i>	<i>Flavipanurgus venustus</i>
<i>Helicigona lapicida</i>	<i>Juncus valvatus</i>	<i>Leiostyla anglica</i>
<i>Lucanus barbarossa</i>	<i>Lynx pardinus</i>	<i>Malus sylvestris</i>
<i>Narcissus asturiensis</i>	<i>Narcissus cyclamineus</i>	<i>Narcissus triandrus</i>

Portuguese legislation does list protected tree species and, for example, it is forbidden to cut any cork oaks (*Quercus suber*), and holm oaks (*Quercus ilix*, *Quercus rotundifolia*; protective measures by Law Nr. 155/2004) and European holly (*Ilex aquifolium*; protective measures by Law Nr. 423/89).

Climate change and the occurrence of extreme meteorological events have increased the phenomenon of forest fires, mainly medium and big fires (more than 100 ha), one of the largest perceived risks in the portuguese forestry sector. Climate change may also induce pests and diseases due to stress in host plants. In Portugal, phytosanitary problems affect mainly the cork oak and holm oak, showing its decline. The loss of vitality and the mortality of maritime pine is mainly related with the Wood Pine Nematode (WPN), detected in Portugal in 1999.

In Portugal, wood products sustain a relevant and integrated industrial chain based on natural resources that, in turn, support a strong export sector. Therefore, forests and forestry products are seen as an area of crucial importance to the portuguese economy. The forest sector has a significant impact on its GDP - higher than the European average. The forest sector represents almost 10% of the national export trade and 2% of the Gross Value Added. Forests are also the base of an economic sector which generates around 100.000 direct jobs (4% of the active population).

2.3 Actions taken to promote certification amongst feedstock supplier

Reginacork's feedstock and forestry suppliers are constantly informed of the importance of certified wood supply.

In 2020 an increase in certified suppliers was reported and same in 2021: 7 forestry services suppliers (more 3 than in 2020), and 3 feedstock suppliers (more 2 than in 2020), are FSC® certified.

2.4 Quantification of the Supply Base

Supply Base

- a. **Total Supply Base area (million ha):** 3,20
- b. **Tenure by type (million ha):**2.85 (Privately owned), 0.25 (Community concession), 0.10 (Public)
- c. **Forest by type (million ha):**3.20 (Temperate)
- d. **Forest by management type (million ha):**1.80 (Plantation), 1.40 (Managed natural)
- e. **Certified forest by scheme (million ha):**0.54 (FSC), 0.32 (PEFC)

Describe the harvesting type which best describes how your material is sourced: Thinning

Explanation: Sporadic selective cutting can take place but in general no clear cut applies to the production of industrial pellets. Areas of clear cut are very small in Portugal due to the nature of small private properties. For SBP pellets Reginacork uses mainly forest residues from forest maintenance operations, tops, branches, twigs, low grade stems. These are chipped in the forest by Reginacork's teams or contracted to other forestry companies. The machinery used in forest operations are chainsaws, forwarders, tractors, mobile chipping processors.

Was the forest in the Supply Base managed for a purpose other than for energy markets? Yes - Majority

Explanation: Wood pellets are mainly made of pine species and forest residues. Sawmills use the main part of the pine wood stems. Damaged and twisted stems, as well as diseased trees and burnt wood may be used for wood pellets production. Stone or umbrella pine is mainly used to produce pine nut and mostly the thinning and pruning by-products are used for pellet production. This pine species is mainly found in the south regions of Portugal, where most of Reginacork's sourcing areas are located. Plantations of eucalyptus in Portugal are used for the pulp and paper industry.

For the forests in the Supply Base, is there an intention to retain, restock or encourage natural regeneration within 5 years of felling? Yes - Majority

Explanation: Pine species stands regenerate by means of natural regeneration. Eucalyptus planted after the third or fourth rotation. In general, for regeneration of forest stands after harvesting the best forestry practices apply as there is no legislation requiring reforestation.

Was the feedstock used in the biomass removed from a forest as part of a pest/disease control measure or a salvage operation? Yes - Minority

Explanation: In the Supply Base pest outbreaks are not common but forest fires do occur. Reginacork procures forest residues, which reduces the chance on forest fires, a relevant issue in the portuguese forest.

Feedstock

Reporting period from: 01 Jan 2021

Reporting period to: 31 Dec 2021

- a. **Total volume of Feedstock:** 1-200,000 tonnes
- b. **Volume of primary feedstock:** 1-200,000 tonnes

- c. List percentage of primary feedstock, by the following categories.**
- Certified to an SBP-approved Forest Management Scheme: 20% - 39%
 - Not certified to an SBP-approved Forest Management Scheme: 60% - 79%
- d. List of all the species in primary feedstock, including scientific name:** Pinus pinea (Stone pine or umbrella pine); Pinus pinaster (Maritime pine); Acacia spp (Acacia); Populus spp (Poplar); Eucalyptus spp (Eucalyptus); Fraxinus angustifolia (Narrow-leaved ash);
- e. Is any of the feedstock used likely to have come from protected or threatened species?** No
- Name of species: N/A
 - Biomass proportion, by weight, that is likely to be composed of that species (%): N/A
- f. Hardwood (i.e. broadleaf trees): specify proportion of biomass from (%):** 0,03
- g. Softwood (i.e. coniferous trees): specify proportion of biomass from (%):** 99,97
- h. Proportion of biomass composed of or derived from saw logs (%):** 0,00
- i. Specify the local regulations or industry standards that define saw logs:** N/A
- j. Roundwood from final fellings from forests with > 40 yr rotation times - Average % volume of fellings delivered to BP (%):** 0,00
- k. Volume of primary feedstock from primary forest:** 0 N/A
- l. List percentage of primary feedstock from primary forest, by the following categories. Subdivide by SBP-approved Forest Management Schemes:**
- Primary feedstock from primary forest certified to an SBP-approved Forest Management Scheme: N/A
 - Primary feedstock from primary forest not certified to an SBP-approved Forest Management Scheme: N/A
- m. Volume of secondary feedstock:** 0 N/A
- Physical form of the feedstock: N/A
- n. Volume of tertiary feedstock:** 0 N/A
- Physical form of the feedstock: N/A

Proportion of feedstock sourced per type of claim during the reporting period				
Feedstock type	Sourced by using Supply Base Evaluation (SBE) %	FSC %	PEFC %	SFI %
Primary	50,14	49,86	0,00	0,00
Secondary	0,00	0,00	0,00	0,00
Tertiary	0,00	0,00	0,00	0,00
Other	0,00	0,00	0,00	0,00

3 Requirement for a Supply Base Evaluation

Is Supply Base Evaluation (SBE) is completed? Yes

SBE was required since primary feedstock is mainly coming from non-FM-certified properties. The intention of Reginacork is to sell SBP-compliant biomass so SBE was conducted for the Supply Base.

4 Supply Base Evaluation

4.1 Scope

Feedstock types included in SBE: Primary

SBP-endorsed Regional Risk Assessments used: Not applicable

List of countries and regions included in the SBE:

Country: Portugal

Indicator with specified risk in the risk assessment used:

1.1.2 Feedstock can be traced back to the defined Supply Base.

Specific risk description:

The Portuguese timber industry imports much pine feedstock, mostly from Spain. There are several documents that must accompany feedstock supply and identify the origin of the feedstock. See also indicator 1.2.1.

Country: Portugal

Indicator with specified risk in the risk assessment used:

1.2.1 The BP has implemented appropriate control systems and procedures to ensure that legality of ownership and land use can be demonstrated for the Supply Base.

Specific risk description:

47% of the land area of Portugal has no cadastral data. Moreover, the northern and central regions of Portugal are mainly composed by many small private properties. The boundaries of these properties are sometimes disputable. Also, the official registration of the property rights can be outdated. For practical reasons, landowners can decide to sell or transfer (inherit) parts of their property without registering the change. Plots can be abandoned and the property rights can be unclear, some try to take advantage of the situation. Wood lands can also be impounded by the government.

Country: Portugal

Indicator with specified risk in the risk assessment used:

2.1.1 The BP has implemented appropriate control systems and procedures for verifying that forests and other areas with high conservation value in the Supply Base are identified and mapped.

Specific risk description:

The specific risks for this Indicator are HCV 1 -Species diversity, and HCV 3 -Ecosystems and habitats. Portugal has a decreasing biodiversity and most wood lands are managed by small land owners, to whom few requirements on sustainable forest management apply; there is no obligatory analysis of critical ecosystem values. The regional forest management plans are not obligatory for the holders of small forests and plantations. Species diversity, ecosystems and habitats are insufficiently protected considering the majority of the forest operations, mainly in the north and centre of the country. A threat to forests like forest

fire is identified on maps but is not addressed adequately by many forest owners. Many estates are nor or are poorly maintained. SEPNA forest guards do not check on this sufficiently.

Country: Portugal

Indicator with specified risk in the risk assessment used:

2.1.2 The BP has implemented appropriate control systems and procedures to identify and address potential threats to forests and other areas with high conservation values from forest management activities.

Specific risk description:

HCV 1 – Species diversity

There is a specific risk that forest operations on private and communitarian grounds and public areas not managed by ICNF could harm species diversity.

HCV 3 – Ecosystems and habitats

There is a specific risk that forest operations on private and communitarian grounds and public areas not managed by ICNF could harm ecosystems and habitats.

HCV 4 – Critical ecosystem services & HCV 5 – Community needs

There is a specific risk on private, communitarian, and public forest areas not managed by ICNF, subject to clear cutting at dimensions above to the maximum area indicated for each region by the Regional Forestry Management Plan (PROF). There are no indigenous people in Portugal, but it is important to evaluate the interests of the (local) population and social-economic functions of the forests and woodlands (including agricultural or municipal functions). Building fences around forests is most of the time undesirable.

Country: Portugal

Indicator with specified risk in the risk assessment used:

2.1.3 The BP has implemented appropriate control systems and procedures for verifying that feedstock is not sourced from forests converted to production plantation forest or non-forest lands after January 2008.

Specific risk description:

There are no assurances new eucalyptus plantations from after January 2008 are not already maintained or harvested. First maintenance cuts are made after 7, 8 years and the present forest fires result in instant harvesting of plantations. Besides, poplar and other tree species can be considered a plantation and the recent approved law only covers eucalyptus. On 21st March 2017 the Minister Council approved a law proposal that reviews the Legal Regime of Arborisation and Reforestation Actions. It blocks the expansion of eucalyptus plantation areas, allowing new plantations only as compensation for areas previously occupied by eucalyptus and currently abandoned. It will be mandatory that the areas previously occupied by this species shall be cleaned and used for other agricultural or forestry activities. This law does not safeguard this issue sufficiently.

Country: Portugal

Indicator with specified risk in the risk assessment used:

2.2.1 The BP has implemented appropriate control systems and procedures to verify that feedstock is sourced from forests where there is appropriate assessment of impacts, and planning, implementation and monitoring to minimise them.

Specific risk description:

Sometimes no forest plan is available (no PGF, ZIF, PUB, SNAC, as well as no PEFC or FSC certification). Additional assessments of environmental impacts need to be made and recorded before harvest.

Country: Portugal

Indicator with specified risk in the risk assessment used:

2.2.2 The BP has implemented appropriate control systems and procedures for verifying that feedstock is sourced from forests where management maintains or improves soil quality (CPET S5b)

Specific risk description:

In some regions, there is the problem of degradation of (poor) soils due to previous land-use practices and climate change.

Country: Portugal

Indicator with specified risk in the risk assessment used:

2.2.3 The BP has implemented appropriate control systems and procedures to ensure that key ecosystems and habitats are conserved or set aside in their natural state (CPET S8b).

Specific risk description:

In Portugal, key ecosystems and habitats are mostly located in Protected areas and in Classified Areas (Natura 2000). However, approximately 2/3 of classified areas are not included in protected areas of the National Network of Protected Areas. Besides, there are key ecosystems and habitats occurring outside Protected and Classified areas.

Country: Portugal

Indicator with specified risk in the risk assessment used:

2.2.4 The BP has implemented appropriate control systems and procedures to ensure that biodiversity is protected (CPET S5b).

Specific risk description:

About 3.600 species of plants can be found in Portugal. There are 69 taxa of terrestrial mammals, a total of 313 bird species, of which around 35% are threatened in some ways, and 17 amphibians and 34 reptile species that are present in Portugal. Some of the main threats to the biological diversity of Portugal include: change or destruction of habitats; pollution; overexploitation; invasive alien species; urbanization and fires.

Country: Portugal

Indicator with specified risk in the risk assessment used:

2.2.6 The BP has implemented appropriate control systems and procedures to verify that negative impacts on ground water, surface water and water downstream from forest management are minimised (CPET S5b).

Specific risk description:

The thresholds mentioned by law are 50 ha and 10 ha. A clear-cut area of less than 10 ha can easily create runoff and erosion dangers. The landscape can create dangerous situations; residents can be living in the valley. Small land owners are not obliged to take risks to the surroundings into consideration. These risks can also be related to water lines.

Country: Portugal

Indicator with specified risk in the risk assessment used:

2.3.2 Adequate training is provided for all personnel, including employees and contractors (CPET S6d).

Specific risk description:

This is not covered sufficiently. The National Strategy for Forests states that the focus on the professionalization and training of the different actors in the forestry sector is of key importance for increasing the competitiveness and, thereby, the development of the sector.

Country: Portugal

Indicator with specified risk in the risk assessment used:

2.4.1 The BP has implemented appropriate control systems and procedures for verifying that the health, vitality and other services provided by forest ecosystems are maintained or improved (CPET S7a).

Specific risk description:

In the NRAs are highlighted the 'health, vitality and other services provided by forest ecosystems' to the forest ecosystems. Nevertheless there is insufficient assessment of the impact of harvesting operations that replace (destroy) the existing forest ecosystem. Forests can be of importance to the environment around the forests, they can reduce the impact of extreme weather, and reduce the impact of air-pollution, and noise. For example, it takes only one dense forest stand to improve the perception of an area to cover up 'visual pollution'. Forest (ecosystems) can be essential for: a. Breaking hard winds and rainfall (roads and houses); b. Recreation in and around the forests; c. Hunting, fishing and gathering of berries and mushrooms; d. Agriculture near the forests (this is of importance in Portugal). The use of wild products by communities is common practise in Portugal (mushrooms, asparagus, snails, fishing on public waters).

Country: Portugal

Indicator with specified risk in the risk assessment used:

2.4.2 The BP has implemented appropriate control systems and procedures for verifying that natural processes, such as fires, pests and diseases are managed appropriately (CPET S7b).

Specific risk description:

Pests, diseases and fires are today the greatest perceived risks in the Portuguese forest sector. As stated in previous indicator biotic and abiotic risks are supported by disturbances affect in 2011 24% of the forest area, generated by a regressive vicious cycle that combines fire, 'seca', pests, diseases and invasive species.

Country: Portugal

Indicator with specified risk in the risk assessment used:

2.5.1 The BP has implemented appropriate control systems and procedures for verifying that legal, customary and traditional tenure and use rights of indigenous people and local communities related to the forest, are identified, documented and respected (CPET S9).

Specific risk description:

The rights of local communities could be violated. If the land area to be harvested is fenced, moreover, if it has been recently fenced, the opinion of residents needs to be assessed. Abuse of fences, blocked roads, and inadequate signs makes the feedstock non-compliant to the requirements of the SBE. In Portugal, entering private forest lands is not considered an invasion, the use of wild products is common practise and there are no indigenous people.

Country: Portugal

Indicator with specified risk in the risk assessment used:

2.6.1 The BP has implemented appropriate control systems and procedures for verifying that appropriate mechanisms are in place for resolving grievances and disputes, including those relating to tenure and use rights, to forest management practices and to work conditions.

Specific risk description:

There are a very large number of land owners with extremely small forested properties in Portugal. Some regions of the country lack cadastral data, which gives problems on assessing the boundaries of harvesting plots. Cultural and social interests could be overlooked. The aim is to track down and solve grievances and disputes before the harvesting operations commence, with special attention to the indicators, which are categorised 'specified risk'.

Country: Portugal

Indicator with specified risk in the risk assessment used:

2.8.1 The BP has implemented appropriate control systems and procedures for verifying that appropriate safeguards are put in place to protect the health and safety of forest workers (CPET S12).

Specific risk description:

International Trade Union Confederation (IUTC) ranks countries against 97 indicators to assess where workers' rights are best protected. Portugal has a rating of 3 (from 1 to 5+). This score is given for countries where: (There are) 'Regular violation of rights. The government and/or companies are regularly interfering in collective labour rights. There are deficiencies in laws and/or certain practices which make frequent violations possible.'

Country: Portugal

Indicator with specified risk in the risk assessment used:

2.9.1 Feedstock is not sourced from areas that had high carbon stocks in January 2008 and no longer have those high carbon stocks.

Specific risk description:

This risk has a regional to local character and is specifically related to the risks mentioned in the indicators 2.1.3 (land conversion), and 2.2.2 (degradation of soils). For example, the conversion of forests to urban use is significant (28 thousand ha). In total, the forest area in Portugal has been decreasing, 85% of these forest lands were converted to 'weeds and pastures' (between 1995 and 2010, according to the ICNF). Forest owners can choose to start an orchard, governments can decide to extend the area of urban lands. This occurs regularly in Portugal. When forests are converted to other land use the carbon stock is lost. One of the 5 principles of FSC Controlled Wood states that wood from converted land is not acceptable, in practise, however, this point is not evaluated by wood procuring companies, which normally consider all procurements from Portugal at least FSC CW.

4.2 Justification

Reginacork has chosen to implement the SBP Supply Base Evaluation method (SBP Standard 1), because there are many small forest owners and the development of FSC® (or PEFC) group certification has recently started to develop. Clients of industrial wood pellets are demanding deliveries of SBP-compliant biomass already today. Moreover, the risks to forestry in Portugal are limited and possible to mitigate. Forest operations, done by Reginacork's own harvesting teams and by its wood suppliers, wood harvesting companies, are based on national and international best practises. Reginacork is interested to obtain international recognition considering the quality and sustainability of forest operations and is motivated to cooperate with forest land owners to implement risk mitigation measures, regarding forestry in Portugal. Reginacork has in place a monitoring procedure to check forest operations. During the forest sites and company visits the transparency and compliance with SBP sustainable feedstock indicators are checked and the results are recorded. Reginacork has the responsibility for carrying out the SBP risk assessment on forestry in the relevant regions and implementing mitigation measures to manage risks in such a way that the risks are under control. The Supply Base Evaluation procedure also ensures active engagement with a diverse range of stakeholders.

4.3 Results of risk assessment and Supplier Verification Programme

The risk assessment has been developed on basis of SBP Standards 1 and 2, version 1.0 of March 2015. Reginacork has assessed the risks related to each SBP indicator. Reginacork has an in-depth understanding of the feedstock sourcing risks. Considering Continental Portugal and the forest operations of Reginacork, most risks are low, mainly because: a. Reginacork does not source protected tree species and mainly conducts maintenance operations; b. A stable cultural, juridical, and economical balance in the forestry sector; c. Low corruption in forestry (the Corruption Perception Index 2021 in Portugal is 62); d. The Portuguese law requires feedstock supply to be accompanied with an AT Guide for all tree species and Felling Manifests for pine. These documents state the tree species, traded volumes, land owners and place of harvest.

In accordance with SBP requirements, Reginacork can accurately classify and describe the tree species, types and categories of primary feedstock, as also the approximate share of round wood from final fellings. Reginacork accepted all the specified risks in draft SBP NRA and addresses more. However, in practise, there is an overlap in the causes of the specified risks and the means to mitigate them. Regarding the harvesting operations within the SBE program, the forest area is always inspected before harvesting operations commence. Before the field inspection, possible conservation values and risks are evaluated by

means of a desk study. Useful in this evaluation is the website of WWF, called HABEaS Portugal, which provides information on many kinds of environmental aspects. The RA had no inconclusive indicators and supplier verification programme was not developed to determine the level of risk for inconclusive indicators. However, suppliers are checked on a continuous basis by Reginacork for every plot from which potentially SBP-compliant feedstock could be sourced from. Reginacork collects all legal documents from a supplier before starting operations and reports every company visit and every field inspection.

4.4 Conclusion

Discussion points and opinions on possible sustainability risks in feedstock procurement in Portugal have been studied in detail over the last years during the process of the SBP NRA. In general, there is a good understanding of the need of performing additional Risk Mitigating Measures (RMMs). In general, many specified risks were found during the SBP SBE of Reginacork; they are, however, manageable. Legality is supported by FSC Controlled Wood Certification and Due Diligence System in place. Forestry in Portugal has a long history and, in general, sustainability is respected. A strength of Reginacorks' SBE is a 100% or close check of potentially compliant plots and harvesting teams by the forestry specialist. If any of the specified risks are not able to be mitigated the wood is not taken as SBP-compliant feedstock. In this way the full compliance with SBP Standards is ensured.

5 Supply Base Evaluation process

The Supply Base Evaluation took the final draft of the SBP National Risk Assessment (NRA) for Portugal into consideration, as also national legislation, national policies, and annual reports and publications of relevant institutions and authorities. During the preparation of the SBE, a detailed baseline study was made for each of the SBP indicators. A summarised description on each indicator is presented in Annex 1, and covers all relevant indicators of SBP Standard 1.

The certification team took the following steps in developing the Supply Base Evaluation:

- Develop the Risk Assessment and additional Risk Mitigation Measures (RMM) in cooperation with the suppliers of Reginacork (discussions on risks and analyses of non-conformities);
- Study the draft SBP National Risk Assessments (NRA) and compare it with Reginacork's own experience and procedures;
- Incorporate the RMM in the procedures of Reginacork (adapt and develop procedures and check-lists related to feedstock procurement);
- Train harvesting teams of Reginacork;
- Evaluate the RMM during harvesting operations of feedstock suppliers in practise.

Relevant documents are:

- Signed declarations of selected feedstock suppliers and land owners (wood on stem);
- Documentation accompanying feedstock supply related to the FSC evaluation of Controlled Wood (verifying the origin of the wood);
- Evaluation of the risks and possible impacts of harvesting operations;
- Best practices regarding harvesting operations;
- Monitoring procedure;
- Harvesting plot assessment checklists;
- Complaint procedures and journals.

The Risk Assessment (RA) resulted in 17 specified risks (no inconclusive indicators).

Approval of harvesting teams and feedstock suppliers

Reginacork subcontracts harvesting teams, which are working mainly for one land owner. The SBE approval system focusses on legal approval of suppliers.

Site visits are conducted continuously to check operational performance and see how mitigation measures are implemented in practise. As described in the following subsection, Reginacork, does not categorise all feedstock coming from the SBE approved subcontractors as 'SBP-compliant feedstock'. Reginacork's procedures regarding its harvesting teams, feedstock suppliers and their harvesting operations, include:

- Selecting harvesting teams (and feedstock suppliers) that comply on the additional requirements to achieve 'SBP-compliant biomass';
- Training harvesting teams (and feedstock suppliers) – best forest practices, health and safety procedures, protected species list;
- Checking performance of harvesting teams (and feedstock suppliers);

Implementation mitigation measures and acceptance of feedstock

The SBE was developed in 2017. The practical implementation of the risk mitigation measures is a continuous process,

because new plots are being prepared for harvesting operations all the time. Risks and mitigation measures need to be specified on the level of practical harvesting operations.

To address all possible risks, additions were made to several of the procedures of Reginacork. Important is the assessment of the plots prior to harvesting.

Steps taken to guarantee sustainable management of wood lands:

- Studying publicly available and other information regarding the plots where harvesting operations are planned and their surroundings;
- Evaluation of the risks and possible impacts of harvesting operations;
- Informing from forestry specialist on found results on possible risks;
- Onsite assessment of the plots and their surroundings prior to harvesting, measures are taken when the possible risks related to the plot prove to be applicable; for example, when habitats are found;
- Checking possible local interests, future plans regarding the land, and complaint management;
- Development of adaptations to the harvesting plans, if needed;
- Records are kept on the evaluation of risks, the investigation of the plot and its surroundings, and the performed measures.

Inspections of harvesting sites and feedstock suppliers include:

- The harvesting activities of harvesting teams and feedstock suppliers;
- The administration of the primary feedstock suppliers;

Considering the situation in Portugal, in which there are more than half a million forest owners, and most own only a few hectares of land, not all feedstock provided by the SBE approved feedstock suppliers will automatically become SBP-compliant feedstock. There are factors beyond the reach of the SBE approved feedstock suppliers, for example, if an estate has been poorly managed by a land owner. Reginacork does not categorise feedstock as compliant, if the wood land was insufficiently managed in the past or will be converted in the future.

Reginacork does not categorise feedstock as compliant, when:

- Prior to the harvesting operations, land owners have managed their wood lands insufficiently;
- The harvesting operations do not comply with the requirements on sustainability (SBP Standard 1)
- If future management of the land will not comply with the requirements on sustainability (SBP Standard 1), for example, because land conversion to urban use is planned

Whenever violations of the FSC Controlled Wood are found, such as violation of HCVs, the feedstock is not accepted as FSC Controlled Wood by Reginacork. Violations of the SBP SBE indicators withhold volumes to be accepted as 'SBP-compliant feedstock' (it is recorded as 'SBP-controlled feedstock').

6 Stakeholder consultation

The risk assessment has been sent to a large group of stakeholders and leading experts in nature conservation and forestry (more than 100 relevant stakeholders were contacted). The stakeholder consultation was open from 3 November 2017 till 4 December 2018.

Reginacork made its stakeholder consultation on 17 March 2018, using Portuguese and English language on every documents (SBE, SBR, email) open till 13 April 2018.

6.1 Response to stakeholder comments

7 Mitigation measures

7.1 Mitigation measures

Country: Portugal

Specified risk indicator: 1.1.2 Feedstock can be traced back to the defined Supply Base.

Specific risk description: The Portuguese timber industry imports much pine feedstock, mostly from Spain. There are several documents that must accompany feedstock supply and identify the origin of the feedstock. See also indicator 1.2.1.

Mitigation measure: Reginacork does not buy any wood from wood suppliers without a valid company registration and delivery documentation indicating the place of harvest. The Due Diligence System and the 'Procedure on the legality and origin of raw material' state appropriate control systems. See also indicator 1.2.1.

The feedstock is rejected from being SBP-compliant feedstock if it is not possible to demonstrate compliance with this risk indicator after mitigation measures.

Country: Portugal

Specified risk indicator: 1.2.1 The BP has implemented appropriate control systems and procedures to ensure that legality of ownership and land use can be demonstrated for the Supply Base.

Specific risk description: 47% of the land area of Portugal has no cadastral data. Moreover, the northern and central regions of Portugal are mainly composed by many small private properties. The boundaries of these properties are sometimes disputable. Also, the official registration of the property rights can be outdated. For practical reasons, landowners can decide to sell or transfer (inherit) parts of their property without registering the change. Plots can be abandoned and the property rights can be unclear, some try to take advantage of the situation. Wood lands can also be impounded by the government.

Mitigation measure: Reginacork does not buy any wood from wood suppliers without a valid company registration, nor from wood lands, of which the owner rights are disputed. Any dispute concerning the ownership of the feedstock needs to be solved first.

When starting business relationship with the owner or a wood supplier, Reginacork investigates if geometric cadastre is available and if not, additional investigations are conducted by means of legal document

research and extends to, for example, interviewing local stakeholders (owners of neighbouring wood lands) and local authorities, whenever:

- Cadastral data are unavailable;
- The land will be impounded by the government;
- There are complaints about the land owner, or the harvest operation.

In these cases, the internal procedure 'Procedure on the legality and origin of raw material' is activated.

The Due Diligence System and the 'Procedure on the legality and origin of raw material' state appropriate control systems.

The following requirements are met:

- Identification of the plot / area ;
- Identification of the owner (citizen card);
- Proof of the relationship between the seller and the land in question;
- Purchase and sale agreement between the parties;
- Mapping;
- Invoice and bankpayment;
- Check owner of bank account;
- Caderneta Predial Rustica is demanded.

In addition to the information collected, at least one site visit is always conducted with the owner or his representative, where information is taken about:

- Type of vegetation / species;
- Ground boundaries / Confrontations;
- Accesses.

This procedure also indicates the resolution of grievances and disputes, including those relating to tenure and land use rights to forest (or land) management practices and working conditions.

The feedstock is rejected from being SBP-compliant feedstock if it is not possible to demonstrate compliance with this risk indicator after mitigation measures.

Country: Portugal

Specified risk indicator: 2.1.1 The BP has implemented appropriate control systems and procedures for verifying that forests and other areas with high conservation value in the Supply Base are identified and mapped.

Specific risk description: The specific risks for this Indicator are HCV 1 -Species diversity, and HCV 3 - Ecosystems and habitats. Portugal has a decreasing biodiversity and most wood lands are managed by small land owners, to whom few requirements on sustainable forest management apply; there is no obligatory analysis of critical ecosystem values. The regional forest management plans are not obligatory for the holders of small forests and plantations. Species diversity, ecosystems and habitats are insufficiently protected considering the majority of the forest operations, mainly in the north and centre of the country. A threat to forests like forest fire is identified on maps but is not addressed adequately by many forest owners. Many estates are nor or are poorly maintained. SEPNA forest guards do not check on this sufficiently.

Mitigation measure: The control system for feedstock, which also includes regular inspections to suppliers, is duly implemented. All used material is traceable to its origin through the harvest manifests and transport guides. All suppliers have to comply with the laws in force, which are supervised by the Tax Authority and the ICNF (Please see the file 'Plano Regional de Ordenamento Florestal' 'Documentation point 4 'cartografia síntese' (ICNF) for each region). Some HCV areas are designated as protected and classified areas at the national or EU level (Natura 2000). There are also smaller areas or biotopes important to biodiversity, or classified as priority species' habitats.

Reginacork identifies and maps areas with high conservation values (HCVs). HCV 1, 3, 4, and 5 were assessed to have a specified risk. Extra effort is needed to identify and map these values. Internet sources, as well as the local situation needs to be studied.

Below the main sources of information, used to prepare the identification of these values for our harvesting teams. The forestry specialist evaluate every plot before the harvesting operations begin. Reginacork inspects the suppliers and harvesting areas.

HCV 1 – Species diversity:

Ø Classified areas: <http://www.icnf.pt/portal/naturaclas/cart>

Ø Protected area plans: <http://www.icnf.pt/portal/naturaclas/ordgest/poap>

Ø Endangered species: <http://www.icnf.pt/portal/naturaclas/patrinatur/especies>

Ø Endemic species:

http://naturdata.com/index.php?option=com_content&view=article&id=78&Itemid=60

Ø Digital mapping information from the Manual das Linhas Eléctricas [Manual of Electric Lines] (ICNB 2008)

- Ø Important Bird Areas of Portugal at: <http://ibas-terrestres.spea.pt/>
- Ø Important Regional Forest Plans (PROF): <http://www.icnf.pt/portal/florestas/profs>

HCV 3 – Ecosystems and habitats:

- Ø Habitats Directive (2007-2012)
- Ø Rede Natura 2000 database: <http://www.icnf.pt/portal/naturaclas/rn2000>
- Ø Important Bird Areas of Portugal at: <http://ibas-terrestres.spea.pt/>
- Ø Convention on Biological Diversity (CBD) via DL no. 21/93, dated 29 June

HCV 4 – Critical ecosystem services & HCV 5 – Community needs:

- Ø Habeas-Hotspot Areas for Biodiversity and Ecosystem Services http://www.habeas-med.org/webgis/pt_en/
- Ø Forests located in critical areas - defined and mapped in REN-National Ecological Reserve.

The feedstock is rejected from being SBP-compliant feedstock if it is not possible to demonstrate compliance with this risk indicator after mitigation measures.

Country:	Portugal
Specified risk indicator:	2.1.2 The BP has implemented appropriate control systems and procedures to identify and address potential threats to forests and other areas with high conservation values from forest management activities.
Specific risk description:	<p>HCV 1 – Species diversity</p> <p>There is a specific risk that forest operations on private and communitarian grounds and public areas not managed by ICNF could harm species diversity.</p> <p>HCV 3 – Ecosystems and habitats</p> <p>There is a specific risk that forest operations on private and communitarian grounds and public areas not managed by ICNF could harm ecosystems and habitats.</p> <p>HCV 4 – Critical ecosystem services & HCV 5 – Community needs</p> <p>There is a specific risk on private, communitarian, and public forest areas not managed by ICNF, subject to clear cutting at dimensions above to the maximum area indicated for each region by the Regional Forestry Management Plan (PROF). There are no indigenous people in Portugal, but it is important to evaluate the interests of the (local) population and social-economic functions of the forests and woodlands (including</p>

agricultural or municipal functions). Building fences around forests is most of the time undesirable.

Mitigation measure:

The control system for feedstock, which also includes regular inspections of suppliers, is duly implemented. All used material is traceable to its origin through the harvest manifests and transport guides. All suppliers have to comply with the laws in force, which are supervised by the Tax Authority and the ICNF (Please see the file 'Plano Regional de Ordenamento Florestal' 'Documentation point 4 'cartografia síntese' (ICNF) for each region). Some HCV areas are designated as protected and classified areas at the national or EU level (Natura 2000). There are also smaller areas and biotopes important to biodiversity, which can be classified as priority species' habitats.

Reginacork identifies and addresses potential threats to forests and other areas with high conservation values (HCVs). HCV 1, 3, 4, and 6 were assessed to have a specified risk.

Reginacork ensures:

- mapping of the harvesting plot,
- identification of the owner rights,
- harvesting according to the technical rules sustainable forest management,
- best practices, respecting environmental and safety rules,
- cleaning of waste from plantations
- tree species (no genetically modified trees)

The forestry specialist evaluate every plot before the harvesting operations begin.

Reginacork inspects the suppliers and harvesting. Reginacork keeps records of field inspections and monitoring results.

HCV 1 – Species diversity

There is a specified risk that forest operations on private and communitarian grounds and public areas not managed by ICNF could harm species diversity. Species diversity is evaluated and recorded before harvesting operations commence. Caution and best practises are applied. Special attention is given to the National System of Classified Areas (SNAC) and to the Important Bird and Biodiversity Areas (IBAs).

See also indicator 2.2.4

HCV 3 – Ecosystems and habitats

There is a specified risk that forest operations on private and communitarian grounds and public areas not managed by ICNF could harm ecosystems and habitats. In these situations, the supplier Reginacork demands to evaluate the environmental impacts (on Ecosystems and habitats) of the forest operations (before the forest operations commence). Caution and best practises are applied. The forest specialist of Reginacork checks the environmental assessment and does field inspections. The inspections are recorded.

See also indicator 2.2.3

HCV 4 – Critical ecosystem services & HCV 5 – Community needs

This is a specified the risk on private, communitarian, and public forest areas not managed by ICNF, subject to clear cutting at dimensions above to the maximum area indicated for each region by the Regional Forestry Management Plan (PROF). This point is evaluated and recorded before the forest operations commence. Caution and best practises are applied. Clear cuts are reduced to the maximum size indicated in the PROFs, or even further, if the environmental aspects, such as hillslopes, require special attention.

There are no indigenous people in Portugal, but it is important to evaluate the interests of the (local) population and social-economic functions of the forests and woodlands (including agricultural or municipal functions). The legal right to passing the property must be respected.

See indicators 2.1.1, 2.2.2, 2.2.3, 2.2.6, 2.4.1 and 2.5.1 (and 2.6.1 as 'safety net').

The feedstock is rejected from being SBP-compliant feedstock if it is not possible to demonstrate compliance with this risk indicator after mitigation measures.

Country:

Portugal

Specified risk indicator: 2.1.3 The BP has implemented appropriate control systems and procedures for verifying that feedstock is not sourced from forests converted to production plantation forest or non-forest lands after January 2008.

Specific risk description: There are no assurances new eucalyptus plantations from after January 2008 are not already maintained or harvested. First maintenance cuts are made after 7, 8 years and the present forest fires result in instant harvesting of plantations. Besides, poplar and other tree species can be considered a plantation and the recent approved law only covers eucalyptus. On 21st March 2017 the Minister Council approved a law proposal that reviews the Legal Regime of Arborisation and Reforestation Actions. It blocks the expansion of eucalyptus plantation areas, allowing new plantations only as compensation for areas previously occupied by eucalyptus and currently abandoned. It will be mandatory that the areas previously occupied by this species shall be cleaned and used for other agricultural or forestry activities. This law does not safeguard this issue sufficiently.

Mitigation measure: Reginacork considers all pine stands as forests and eucalyptus and Poplar stands as plantations. Reginacork checks if forests have been changed to (eucalyptus) or Poplar plantations after 2008. When an eucalyptus or and Poplar plantation is cut the history of the plantation is investigated. First the age of the plantation is determined. If could be form after Jan. 2008, the land owner and/or residents are questioned, and the plot is searched for old tree stumps.

Reginacork always demands a field study assessment by the forestry specialist. Reginacork checks the assessment of its suppliers and keeps records on monitoring harvesting plots.

The feedstock is rejected from being SBP-compliant feedstock if it is not possible to demonstrate compliance with this risk indicator after mitigation measures.

Country: Portugal

Specified risk indicator: 2.2.1 The BP has implemented appropriate control systems and procedures to verify that feedstock is sourced from forests where there is appropriate assessment of impacts, and planning, implementation and monitoring to minimise them.

Specific risk description: Sometimes no forest plan is available (no PGF, ZIF, PUB, SNAC, as well as no PEFC or FSC certification). Additional assessments of environmental impacts need to be made and recorded before harvest.

Mitigation measure: Reginacork makes an 'Evaluation of the risks and possible impacts of harvesting operations' (EoR) on sites related to the SBE program. The EoR and the field study of the supplier evaluate:

- The possible economical, ecological and social impact of the forest operations including its surroundings. Harvesting operations can be changed to avoid negative impacts.

- T The quality of the management (by the land owner) prior to harvesting and regeneration plan.

Indicators 2.2.2, 2.2.3, 2.2.4, 2.2.6, and 2.4.2 include relevant management measures which are checked.

Reginacork monitors the plots to be harvested intensively and and the performed Risk Mitigation Measures.

The feedstock is rejected from being SBP-compliant feedstock if it is not possible to demonstrate compliance with this risk indicator after mitigation measures.

Country: Portugal

Specified risk indicator: 2.2.2 The BP has implemented appropriate control systems and procedures for verifying that feedstock is sourced from forests where management maintains or improves soil quality (CPET S5b)

Specific risk description: In some regions, there is the problem of degradation of (poor) soils due to previous land-use practices and climate change.

Mitigation measure: Before harvesting operations commence the plot is evaluated on this point and records are kept. Best forestry practises are applied. Maps can be obtained from 'Reserva Ecológica Nacional' (REN).

Reginacork makes an Evaluation of the risks and possible impacts of harvesting operations (EoR) and conducts field study with the help of forestry specialist. The assessments address the specified risk on soil degradation: Best practices regarding harvesting operations have to be applied.

- a. Low intensity of forestry, selective cuttings and small clear cuts of maximally 5 ha. were needed considering the soil and groundwater level.
- b. Regeneration focusses on tree species that maintain or improve soil quality
- c. Leave nutrients in the forests, mainly the green fraction of forest residues (on the other hand other forest residues need to be cleared to prevent forest fires.
- d. Do not operate near-water areas.

For example, on dry locations (elevated grounds or on slopes) selective cuttings are required, because the ground gets less direct impact of the sun and the forest and (natural) regeneration can maintain soil quality. On other locations (small) clear cuts can sometimes have the advantage that several kinds of broadleaved trees regenerate naturally, what improves soil quality. After clear cuts, the groundwater level can rise, what sometimes is an advantage, sometimes a disadvantage.

Poor soil quality can lead to erosion, etc; this indicator is related to indicator 2.2.6.

The feedstock is rejected from being SBP-compliant feedstock if it is not possible to demonstrate compliance with this risk indicator after mitigation measures.

Country:	Portugal
Specified risk indicator:	2.2.3 The BP has implemented appropriate control systems and procedures to ensure that key ecosystems and habitats are conserved or set aside in their natural state (CPET S8b).
Specific risk description:	In Portugal, key ecosystems and habitats are mostly located in Protected areas and in Classified Areas (Natura 2000). However, approximately 2/3 of classified areas are not included in protected areas of the National Network of Protected Areas. Besides, there are key ecosystems and habitats occurring outside Protected and Classified areas.
Mitigation measure:	Reginacork prepares (publicly available) data on ecosystems and habitats (see above 2.1.1 on mapping and 2.1.2 on identifying and addressing potential threats) with the help of forestry specialist. This information is given to all feedstock suppliers. Feedstock suppliers are provided with training material to recognise key ecosystems and habitats.

Most importantly, the forestry specialist inspect visually the harvesting plot and report on the results. Key ecosystems and habitats are indicated on the harvesting maps. Best practises are used to protect the high ecological values. The harvesting operations conserve these objects, mainly by not cutting the woodland or forest directly around them. In exceptional cases, low intensity harvesting operations are possible without damaging these objects.

- a. Study key ecosystems on the harvesting plot, conserve areas of ecological value
- b. Study flora and fauna at the harvesting plot, nests, breeding areas, anthills conserve protected tree species and habitats

c. Do not operate near-water areas.

Reginacork makes an Evaluation of the risks and possible impacts of harvesting operations (EoR) and conducts the field study. Reginacork monitors the harvesting operations of its feedstock suppliers (see also chapter 5 on 'SBE program approved feedstock suppliers').

The feedstock is rejected from being SBP-compliant feedstock if it is not possible to demonstrate compliance with this risk indicator after mitigation measures.

Country: Portugal

Specified risk indicator: 2.2.4 The BP has implemented appropriate control systems and procedures to ensure that biodiversity is protected (CPET S5b).

Specific risk description: About 3.600 species of plants can be found in Portugal. There are 69 taxa of terrestrial mammals, a total of 313 bird species, of which around 35% are threatened in some ways, and 17 amphibians and 34 reptile species that are present in Portugal. Some of the main threats to the biological diversity of Portugal include: change or destruction of habitats; pollution; overexploitation; invasive alien species; urbanization and fires.

Mitigation measure:

- 1) Reginacork prepares (publicly available) data on biodiversity researches and programs, red lists of Portugal, CITES, etc (see above 2.1.1 on mapping and 2.1.2 on identifying and addressing potential threats, HCV 1 – Species diversity). This information is given to all feedstock suppliers.
- 2) Feedstock suppliers is provided by the training material to recognise the protected biodiversity and how to conserve them. These species are often related (it can be indicator species) to key ecosystems which need conserved (previous indicator).
- 3) The forestry specialist inspect visually the plot, make photos and report on the results. Endangered flora and fauna are indicated on the harvesting maps.
- 4) Best practises are used, including measures to conserve and increase biodiversity (for example, standing dead wood, prescribed burning and other disturbances improving the conditions for endangered species flora and fauna).
- 5) Reginacork monitors the harvesting operations of its feedstock suppliers (see also chapter 5 on 'SBE program approved feedstock suppliers').

The feedstock is rejected from being SBP-compliant feedstock if it is not possible to demonstrate compliance with this risk indicator after mitigation measures.

Country: Portugal

Specified risk indicator: 2.2.6 The BP has implemented appropriate control systems and procedures to verify that negative impacts on ground water, surface water and water downstream from forest management are minimised (CPET S5b).

Specific risk description: The thresholds mentioned by law are 50 ha and 10 ha. A clear-cut area of less than 10 ha can easily create runoff and erosion dangers. The landscape can create dangerous situations; residents can be living in the valley. Small land owners are not obliged to take risks to the surroundings into consideration. These risks can also be related to water lines.

Mitigation measure:

- 1) Reginacork studies data (from publicly available information, researches and programs) for its harvesting teams on ground water, surface water and steams (see above 2.1.1 on mapping and 2.1.2 on identifying and addressing potential threats, HCV 1 – Species diversity). This information is given to the feedstock suppliers.
- 2) Feedstock suppliers are trained to not contaminate ground water and to plan forest management operations that protect the soil, forest and surroundings from surface water.
- 3) The forestry specialist inspect visually the plot and the hill slopes and streams in the surroundings and report on the results.
- 4) Best practises are used, including forest management measures that protect the plot against too high or low ground water levels, and erosion (surface water moving to quick or too slow). Related to a too quick runoff of surface water, streams in the surroundings are considered. The landscape where the harvest operations are executed is considered, including hill slopes and streams that can overflow. In areas vulnerable to water damage, the maximal contiguous clear-cut area is 5 ha.
- 5) Reginacork monitors the harvesting operations of its feedstock suppliers. These best practises are required to comply with the SBE program requirements.

The best practices follow the 'ICNF Handbook for forest best practices': 'In areas surrounding the water lines the risk of erosion is often very high, since these are areas of concentration of rainwater runoff. In these bands (with a minimum width of 10 meters for each side, as stated in the legal definitions and conditions of legal limits (Decree-Law no. 468/71) a strict prevention of erosion phenomena shall be performed, and it is therefore essential to adopt measures to protect it, such as maintaining all or a significant part of the natural vegetation and not inflict harm to the soil.'

The feedstock is rejected from being SBP-compliant feedstock if it is not possible to demonstrate compliance with this risk indicator after mitigation measures.

Country: Portugal

Specified risk indicator: 2.3.2 Adequate training is provided for all personnel, including employees and contractors (CPET S6d).

Specific risk description: This is not covered sufficiently. The National Strategy for Forests states that the focus on the professionalization and training of the different actors in the forestry sector is of key importance for increasing the competitiveness and, thereby, the development of the sector.

Mitigation measure: Reginacork trains its personnel on all relevant aspects and demands the same from its feedstock suppliers.

During the feedstock supplier's office inspections of Reginacork, are checked: the training records, (new) workforce, and the hiring of specialists. The level of knowledge of personnel is inspected during site visits.

The feedstock is rejected from being SBP-compliant feedstock if it is not possible to demonstrate compliance with this risk indicator after mitigation measures.

Country: Portugal

Specified risk indicator: 2.4.1 The BP has implemented appropriate control systems and procedures for verifying that the health, vitality and other services provided by forest ecosystems are maintained or improved (CPET S7a).

Specific risk description: In the NRAs are highlighted the 'health, vitality and other services provided by forest ecosystems' to the forest ecosystems. Nevertheless there is insufficient assessment of the impact of harvesting operations that replace (destroy) the existing forest ecosystem. Forests can be of importance to the environment around the forests, they can reduce the impact of extreme weather, and reduce the impact of air-pollution, and noise. For example, it takes only one dense forest stand to improve the perception of an area to cover up 'visual pollution'. Forest (ecosystems) can be essential for: a. Breaking hard winds and rainfall (roads and houses); b. Recreation in and around the forests; c. Hunting, fishing and gathering of berries and mushrooms; d. Agriculture near the forests (this is of importance in Portugal). The use of wild products by communities is common practise in Portugal (mushrooms, asparagus, snails, fishing on public waters).

Mitigation measure: 1) Forestry specialist is trained to recognise health, vitality and other services provided by forest ecosystems.

2) Forestry specialist inspects visually the plot and the surroundings and report on the results (make photos). Reginacork demands a field study from forestry specialist , which addresses these environmental services.

Best practises are used by the suppliers. Many of the relevant risks are addressed by other indicators (with specified risk), such as indicators 2.2.1, 2.2.2, 2.2.3, 2.2.4, 2.2.6, and 2.4.2.

3) The possible impacts of the harvest operations on the forest and its surroundings are assessed (before the harvesting operations commence), not only in relation to the environment, but also in relation to the interests of the local population, farmers, and people interested in recreation. Reginacork underlines that these services can be of importance to the local population. Forests can be of importance to the environment around the forests, they can reduce the impact of extreme weather, and reduce the impact of air and 'visual' pollution, as well as noise.

Forest services that need to be considered:

- a. Breaking hard winds and rainfall (regarding roads and houses);
- b. Recreation in and around the forests;
- c. Hunting, fishing and gathering of berries and mushrooms;
- d. Agriculture near the forests (this is of importance in Portugal).

4) Reginacork monitors the harvesting operations of its feedstock suppliers. It checks with stakeholders if there are any complaints (see also below 2.6.1).

The feedstock is rejected from being SBP-compliant feedstock if it is not possible to demonstrate compliance with this risk indicator after mitigation measures.

Country:	Portugal
Specified risk indicator:	2.4.2 The BP has implemented appropriate control systems and procedures for verifying that natural processes, such as fires, pests and diseases are managed appropriately (CPET S7b).
Specific risk description:	Pests, diseases and fires are today the greatest perceived risks in the Portuguese forest sector. As stated in previous indicator biotic and abiotic risks are supported by disturbances affect in 2011 24% of the forest area, generated by a regressive vicious cycle that combines fire, 'seca', pests, diseases and invasive species.

Mitigation measure:

Reginacork studies data (from publicly available information, researches and programs) from harvesting teams on risks and regulations regarding fires, pests and diseases. This information is given to all feedstock suppliers.

2) Feedstock suppliers are trained to recognise poor forest management and on mitigation measures. Reginacork monitors the harvesting operations of its feedstock suppliers. Sufficient management by the forest owner, and best practises by the harvesting teams are required to comply with the SBE program requirements. Best practises are used by the harvesting teams regarding management of fires, pests and diseases. These include:

- a. Traps for NMP (Pine Wood Nematode *Bursaphelenchus xylophilus*, and its vector the insect *Monochamus galloprovincialis*);
- b. Use of net (cover) during transport of wood in the period insect vector NMP;
- c. Phytopharmaceutical application on the ground;
- d. Crushing of the same wood with no lead time of 2, 3 days (wood with symptoms);
- e. Ensure that all suppliers have an economic operator registration;
- f. Reginacork only accepts the raw material with the manifest;
- g. Cleaning of all utensils and machinery used in the handling of woody material;
- h. Application of good forest practices to avoid a spread of this pest.

The Forestry specialist inspects visually the plot and takes photos. The Forestry specialist inspect if the plot was managed well on these points, if not, the feedstock is not considered compliant to the SBE program (will not become SBP-compliant feedstock).

Country:

Portugal

Specified risk indicator:

2.5.1 The BP has implemented appropriate control systems and procedures for verifying that legal, customary and traditional tenure and use rights of indigenous people and local communities related to the forest, are identified, documented and respected (CPET S9).

Specific risk description:

The rights of local communities could be violated. If the land area to be harvested is fenced, moreover, if it has been recently fenced, the opinion of residents needs to be assessed. Abuse of fences, blocked roads, and inadequate signs makes the feedstock non-compliant to the requirements of the SBE. In Portugal, entering private forest lands is not considered an invasion, the use of wild products is common practise and there are no indigenous people.

Mitigation measure:

- 1) Forestry specialist identifies possible issues with legal, customary and traditional tenure and use rights.
- 2) The harvesting teams inspect visually the plot, make photos and report on the results. If the land area to be harvested is fenced, moreover, if it has been fenced recently, the opinion of residents is assessed. Abuse of fences, blocked roads, and inadequate signs makes the feedstock non-compliant the SBE program.
- 3) Reginacork monitors the harvesting operations of its feedstock suppliers. By addressing sustainable forest management and making an extra effort on indicators 1.2.1 and 2.6.1, Reginacork integrates respecting the interests of local people into its main procedures.

There are no indigenous people in Portugal nor minorities dependant on forests for their livelihood.

The feedstock is rejected from being SBP-compliant feedstock if it is not possible to demonstrate compliance with this risk indicator after mitigation measures.

Country:

Portugal

Specified risk indicator:

2.6.1 The BP has implemented appropriate control systems and procedures for verifying that appropriate mechanisms are in place for resolving grievances and disputes, including those relating to tenure and use rights, to forest management practices and to work conditions.

Specific risk description:

There are a very large number of land owners with extremely small forested properties in Portugal. Some regions of the country lack cadastral data, which gives problems on assessing the boundaries of harvesting plots. Cultural and social interests could be overlooked. The aim is to track down and solve grievances and disputes before the harvesting operations commence, with special attention to the indicators, which are categorised 'specified risk'.

Mitigation measure:

- 1) Reginacork actively prevents grievances and disputes to arise. The aim is to track down and solve grievances and disputes before the harvesting operations commence (or not to buy from the disputed plots).
- 2) Reginacork makes clear to the local population that any complaint or comment related to feedstock supply is taken very seriously (via website and other communications). Reginacork takes seriously any complaint of any person or organisation considering harvesting operations. This also ensures sufficient performance on respecting local interests (HCV 5) and cultural values (HCV 6).
- 3) Reginacork has a complaint procedure and keep records. The feedstock suppliers are also required to actively implement a complaint procedure and keep records. Reginacork demands a field study from all feedstock suppliers, in which the interests of local population are assessed.

4) Reginacork monitors the harvesting operations of its feedstock suppliers and checks their records on Complaints and Comments. It checks with relevant stakeholders, such as land owners, if no comments were submitted, or if the complaints were dealt with sufficiently.

5) The results of the inspections of Reginacork have direct influence on the 'SBE program approved' status of feedstock suppliers.

The feedstock is rejected from being SBP-compliant feedstock if it is not possible to demonstrate compliance with this risk indicator after mitigation measures.

Country: Portugal

Specified risk indicator: 2.8.1 The BP has implemented appropriate control systems and procedures for verifying that appropriate safeguards are put in place to protect the health and safety of forest workers (CPET S12).

Specific risk description: International Trade Union Confederation (IUTC) ranks countries against 97 indicators to assess where workers' rights are best protected. Portugal has a rating of 3 (from 1 to 5+). This score is given for countries where: (There are) 'Regular violation of rights. The government and/or companies are regularly interfering in collective labour rights. There are deficiencies in laws and/or certain practices which make frequent violations possible.'

Mitigation measure: Reginacork has a control system and adequate procedures on the health and safety of forest workers. Reginacork (contractually) demands the same from its feedstock suppliers and checks the health safety of harvesting personnel during its monitoring inspections.

During the feedstock supplier's office inspections of Reginacork are checked: the training records, workforce, and the hiring of specialists in forest security. Protective equipment and knowledge of personnel is inspected during site visits.

The feedstock is rejected from being SBP-compliant feedstock if it is not possible to demonstrate compliance with this risk indicator after mitigation measures.

Country: Portugal

Specified risk indicator: 2.9.1 Feedstock is not sourced from areas that had high carbon stocks in January 2008 and no longer have those high carbon stocks.

Specific risk description: This risk has a regional to local character and is specifically related to the risks mentioned in the indicators 2.1.3 (land conversion), and 2.2.2 (degradation of soils). For example, the conversion of forests to urban use is significant (28 thousand ha). In total, the forest area in Portugal has been decreasing, 85% of these forest lands were converted to 'weeds and

pastures' (between 1995 and 2010, according to the ICNF). Forest owners can choose to start an orchard, governments can decide to extend the area of urban lands. This occurs regularly in Portugal. When forests are converted to other land use the carbon stock is lost. One of the 5 principles of FSC Controlled Wood states that wood from converted land is not acceptable, in practise, however, this point is not evaluated by wood procuring companies, which normally consider all procurements from Portugal at least FSC CW.

Mitigation measure:

- 1) Reginacork studies data (from publicly available information, researches and programs) on aspects that can decrease the carbon stock (including regularly lit forest fires).
- 2) The forestry specialist inspects visually the plot and makes photos.
- 3) Reginacork checks plots and harvesting operations.

This risk is partly covered by the mitigation measures mentioned in the following indicators:

- a. 2.1.3 (land conversion),
- b. 2.2.2 (degradation of grounds).

The feedstock is rejected from being SBP-compliant feedstock if it is not possible to demonstrate compliance with this risk indicator after mitigation measures.

7.2 Monitoring and outcomes

Mitigation measures prove to be sufficiently effective. No new risk ratings were established for SBP indicators during the last year. In the last years Reginacork did not witness issues on indicators 1.1.2; 2.4.1.; and 2.5.1., but will maintain all specified risk categorisation till the end of the certification period. 23 plots were accepted as sources of SBP-compliant feedstock and 36 plots considered as sources of SBP-controlled feedstock, after duly studied and checked. Others were classified as sources of SBP-controlled feedstock. Most time is spent on the legality aspects of small-holders, the field inspection has to be done by the Forest Engineer of Reginacork who studies whole plots before and during harvesting, checking the risks and agreeing on the mitigation measures does not take much time, however. The teams chipping the forest residues employed by Reginacork work according the requirements. The forest teams are checked frequently. Of the 7 forest harvesting teams 2 are working excellently. Although not all plots were accepted, this gave, together with the incoming FSC® certified feedstock, sufficient feedstock for Reginacork to fulfill its commercial obligations. The Forest Engineer does not restrict herself to check only the bigger plots, or the easier evaluation plots. Due care of performance is studied for the whole feedstock supply chain, and improvement is pursued in general. By preparing information profoundly by the forestry specialist and by implementing best practices regarding the harvesting operations, a substantial share of the feedstock could comply with the SBE program requirements. All suppliers have a forestry guide and received internal guidance from Reginacork. All harvesting personnel have been instructed to respect the requirements of the guide. Reginacork inspects all harvesting teams and feedstock suppliers. Reginacork constantly monitors its feedstock suppliers to see if they comply with the mitigation measures. The 'SBE program approved' status of suppliers is directly suspended or withdrawn if a major non-conformity has been

found. The feedstock is rejected from being SBP-compliant feedstock if it is not possible to demonstrate compliance with risk indicators after mitigation measures.

8 Detailed findings for indicators

Detailed findings for each Indicator are given in Annex 1 in case the Regional Risk Assessment (RRA) is not used.

Is RRA used? No

9 Review of report

9.1 Peer review

The report has taken into consideration the drafts of the SBP NRA for Portugal and was sent to a large stakeholders group for consultation in the year 2018. Current updates didn't weaker the system, but strengthened it. For example, a forestry specialist was hired to perform the field assessment. Therefore, a peer review was not necessary.

9.2 Public or additional reviews

The SBR and SBE was sent to a large group of stakeholders for review and comments in the year 2018.

Annex 1: Detailed findings for Supply Base Evaluation indicators

	Indicator
1.1.1	The BP Supply Base is defined and mapped.
Finding	The SBE scope is 'Continental Portugal', it is concluded that there is low risk in relation to the definition and mapping of the supply base. Despite the incomplete geometric cadastre of the rural real estate, maps are available, from several sources at an appropriate scale to define geographically the origin of the supply base. The information available from delivery notes, felling manifests, invoices, among other legal documents, which contain the origin of the raw material (county, village) serves as definition of the source which enables, supported on maps available, the mapping of the supply base. Reginacork receives nearly all pine, eucalyptus, poplar from a 60 km radius around the plant, by trucks/lorries. Unloading and transport documents of the raw material include its designation, its origin is legally documented (manifest), identification of the suppliers, loggers, transport companies and documentation of the lorries. This is described below in this document.
Means of Verification	Delivery notes, felling manifests, invoices, among other legal documents. • The scope is defined and justified; • Maps to the appropriate scale are available; • Key personnel demonstrate an understanding of the supply base
Evidence Reviewed	Delivery notes, felling manifests, invoices, among other legal documents. Estrategia Nacional das Florestas (RCM n.º 6-B/2015 - Diário da República n.º 24/2015, 1º Suplemento, Série I de 2015-02-04); ICNF portal (http://www.icnf.pt/portal/icnf/docref/enf) Inventário Florestal Nacional IFN5 (FloreStat_IFN5); ICNF portal (http://www.icnf.pt/portal/florestas/ifn/ifn5/rel-fin) Inventário Florestal Nacional IFN6, preliminary results (IFN6 - Resultados preliminares.pdf); ICNF portal (http://www.icnf.pt/portal/florestas/ifn/ifn6) Estatísticas Agrícolas 2015.xls, Instituto Nacional Estatística (https://www.ine.pt/xportal/xmain?xpid=INE&xpgid=ine_publicacoes&PUBLICACOESpub_bouid=271434407&PUBLICACOESmodo=2) Decreto lei 16-2009 planos gestão florestal (https://dre.pt/application/dir/pdf1sdip/2009/01/00900/0026800273.pdf); ICNF portal (http://www.icnf.pt/portal/icnf/legisl/legislacao/2009/decreto-lei-n.o-16-2009-de-14-de-janeiro.-d.r.-n.o-9-serie-i) Normas Técnicas Planos Gestão Florestal (http://www.icnf.pt/portal/florestas/gf/pgf/resource/doc/manual/normas-tecn-PGF-AFN.pdf)
Risk Rating	Low Risk
Comment or Mitigation Measure	Reginacork selects areas within the Supply Base relevant for its SBE program, which are relatively convenient to assess, because of a clear management situation, for example the availability of management plants (like ZIFs).

	Indicator
1.1.2	Feedstock can be traced back to the defined Supply Base.
Finding	<p>The pellets are at least FSC CW and SBP controlled biomass. Inspections from government are in place and operators must apply DDS to justify legality of timber. Reginacork executes an FSC CW Due Diligence system. Reginacork receives the document 'Manifesto' (a felling manifest is obligatory for all common commercial harvesting activities and shall be submitted to forest authorities (ICNF) up to 30 days after the felling operation) for all pine deliveries. We check the validity of these documents. The felling manifest, as well as the NMP (Pine Wood Nematode) manifest contain the following information: • Operator or service provider information • Localization of the feedstock until the freguesia (small village) level • Quantities harvested • Others In Portugal operators take steps to ensure the legality of their suppliers, which allow compliance with the requirements of forest legislation. For harvesting operations, law No. 174/88 of 17 May is followed. To start any operations in the forest, the document named Manifest is filled and submitted to Direcção Geral dos Recursos Florestais (General Management of Forest Resources). Legal requirements include having the right and valid invoice or transport documentation are in place: • Regular invoice for trading operation or transport documentation or waybill, or devolution note • In case of pine or conifers timber the transporter must have an Economic Operator Registry and a phytosanitary Manifest for each feeling (if one feelings is transported several times it is mandatory to copy the manifest for all the transportations). Information obtained from Centro Pinus (non-profit association for key players of Pine based industry), INE and others shows that pine wood consumption of timber industry in 2014 was 4,360,000 m3 (1,300,000 m3 saw mill industry, 30%; 300,000 m3 biomass, 7% and 1,400,000 m3 pellets, 32% and 1.360.000 other uses not relevant for pellets industry). However, in 2014 there was available only 2,247,000 m3 of pine wood from Mainland Portugal (Pinus pinaster). As an obvious conclusion a lot of imported pine comes into Portuguese timber industry in 2014, mostly from Spain. Similar situation occurs for Eucalyptus in pulp and paper industry, which low quality parts may be also used in biomass industry. Information from Annual Bulletin of CELPA (Paper Industry Association) states that in 2014 it was imported 45% of total eucalyptus wood procured by paper industry (2,415,000 m3 imported), in its vast majority round wood from Spain and at minor extent, chips from South America or Africa (usually FSC/PEFC certified or controlled). SBP Framework Supply Base Report Template for BPs Annex 1 Page 4 Based on the fact that relevant volumes of imported material come into Portugal annually it is noted that imported material it is not covered by this RRA. A felling manifest is obligatory for all common commercial harvesting activities and shall be submitted to forest authorities (ICNF) up to 30 days after the felling operation. A National Action Plan for Control of Pinus Wilt Disease/Nemátodo-da-madeira-do-pinheiro (NMP) (Bursaphelenchus xylophilus) and its vector insect Monochamus galloprovincialis is in place and there is an obligation of previous communication of any felling and/or transportation of wood affected by this disease. The document (phytosanitary manifest) must accompany material until the arrival to industrial processing facilities. This is mostly focused on Pinus pinaster (23% of forest area) main source for BP. The felling manifest, as well as the NMP manifest contain the following information: - Operator or service provider information - Localization of the feedstock until the freguesia (small village) level - Quantities harvested - Others Simultaneously, approval documentation is required for specific operations on cork and holm Oak including cutting and pruning, Holly cutting, and also premature cuttings of Eucalyptus, Pinus pinaster or riparian vegetation. Since 2013 and the introduction of the EUTR laws, operators are required to register their activities on a Digital Platform managed by forest authorities (ICNF). Inspections from government are in place and operators must apply DDS to justify legality of timber. Regarding transportation, legal requirements include having the right and valid invoice or transport documentation are in place: • Regular invoice for trading</p>

	<p>operation or transport documentation or waybill, or devolution note; • CRM on international transportation • In the case of pine or conifers timber the transporter must have an Economic Operator Registry and a phytosanitary Manifest for each felling (if one felling is transported several times it is mandatory to copy the manifest for all the transportations). The issuance of required transport and sales documents is well understood and regulations are largely adhered to. Inspections are common at Portuguese roads and enforcement of regulations is considered adequate. Felling phytosanitary manifest (NMP manifest) includes identification of the origin of the felling. Also documentation for transportation identifies the origin of the transport which could be useful in case of direct transport to BP facilities and in any case is useful in the traceability of material. Both are the most common ways to trace back to origin even if the origin area is not the forest land itself but the freguesia (minimum administrative division) where forest land is included. Several public authorities, such as SEPNA (Department of National Guard responsible for environment surveillance), ASAE (National Authority for the Food and Economic Safety) and ICNF, organize regular surveillance activities to verify the compliance of forest operators and wood transportation companies with the dispositions of SBP Framework Supply Base Report Template for BPs Annex 1 Page 5 the National Action Plan for Control of Pinus Wilt Disease. In 2016, SEPNA inspected 24'535 vehicles carrying wood logs and pallets and identified 424 infractions (1,7%) from which 295 refer to the lack of NMP manifest (1,2%) [Activity Report 2016]. There are systems in place to trace the feedstock primary origin back to the forest stand but it is possible to do so if there are elements in the manifests or transportation documents, which could be used in the cadastral system (as the article number and section) or geographic coordinates in areas without cadastral system. As evidenced by the low Corruption Perception Index of Portugal (63) and the high level of law enforcement documents such as invoices and transport documents are considered reliable sources of information. On the above background, the risk related to the traceability of feedstock back to the supply base is evaluated to be specified due to the lack of compliance of forest operators in delivering all the mandatory documents for every type of raw material delivered, specially, the felling manifest for species other than coniferous. The felling manifest plays an important role for hardwood raw material. In the case of coniferous raw material, the implementation of the phytosanitary felling manifest is widely spread and verified regularly by SEPNA and ASAE. Procedures to ensure the delivery of all mandatory documents shall be put in place.</p>
<p>Means of Verification</p>	<p>Delivery notes, felling manifests, invoices, among other legal documents. Copy of phytosanitary manifests (felling and/or transportation) for all conifers with geographic elements (cadastral and/or coordinates). Copy of delivered felling manifest to Forest Authorities (ICNF) for all commercial harvestings with geographic elements (cadastral and/or coordinates). Invoices, waybills, transport/shipping documents. The existence of a strong legal framework in the region. Feedstock inputs, including species and volumes, are consistent with the defined Supply Base. Transport documentation and goods-in records are consistent with the defined scope of the SBE.</p>
<p>Evidence Reviewed</p>	<p>Delivery notes, felling manifests, invoices, among other legal documents. The issuance of required transport and sales documents is well understood and regulations are largely adhered to. Inspections are common at Portuguese roads and enforcement of regulations is seen to be good. Felling phytosanitary manifest includes identification of the origin of the felling. Also documentation for transportation identifies the origin of the transport which could be useful in case of direct transport. For all other species, Reginacork receives documents on every transport that takes place in the chain from the raw material supplier to Reginacork. The transport documents state: the name and address of the operator and the sender or receiver, the name and quantity/volume of the shipped product, the place of provenance of the raw material and the date of the shipment. The person responsible for the purchase of the raw material is SBP Framework Supply Base Report Template for BPs Annex 1 Page 6 constantly accompanying the loggers and ensuring these issues. Reginacork also has the contract</p>

	<p>agreement that is made with the forest owner which defines the plots where to operate. This way, the harvest team is under the responsibility of Reginacork. Estrategia Nacional das Florestas (RCM n.º 6-B/2015 - Diário da República n.º 24/2015, 1º Suplemento, Série I de 2015-02-04); ICNF portal (http://www.icnf.pt/portal/icnf/docref/enf) Estatísticas Agrícolas 2015.xls, Instituto Nacional Estatística (https://www.ine.pt/xportal/xmain?xpid=INE&xpgid=ine_publicacoes&PUBLICACOESpub_boui=271434407&PUBLICACOESmodo=2) Boletim-Estatístico-da-Celpa-de-2014 (http://www.celpa.pt/wp-content/uploads/2016/09/Boletim_WEB_2015.pdf) Relatório-de-Characterização-da-Fileira-Florestal-2014 (http://www.aiff.org.pt/assets/Relatorio-de-Characterizacao-da-Fileira-Florestal-2014-160p-CAPA-3-spread....pdf) Cutting Permission in Law n.º 33/96, at 17/08 (article 7th) https://dre.pt/application/dir/pdf1sdip/1996/08/190A00/25682573.pdf Fileira do Pinho: desafios e oportunidades (centroPINUS_JoaoGoncalves dados fileira pinho 2014.pdf); Centro Pinus (http://www.centropinus.org/index.php?lingua=1) Decreto lei 123-2015 nematodo do Pinheiro (https://dre.pt/application/file/67649256); ICNF portal (http://www.icnf.pt/portal/florestas/prag-doe/ag-bn/nmp) Declaração Retificação n.º 38/2015 de 01/09 do Decreto lei 123-2015 nematodo do Pinheiro (https://dre.pt/application/file/70144398) Decreto lei 174-1988 manifesto corte (https://dre.pt/application/file/374768); ICNF portal(http://www.icnf.pt/portal/icnf/serv/formularios/manif/man-cort-arr-arvor) Registo de Operador de Madeira e Derivados ICNF portal (http://www.icnf.pt/portal/florestas/fileiras/reg-op) Decreto Lei 198/2012 de 24/08 FATURAS E OUTROS DOCUMENTOS COM RELEVÂNCIA FISCAL (http://info.portaldasfinancas.gov.pt/NR/rdonlyres/907FD2F4-9A9C-485D-8A99-FD164BF9FCEC/0/Decreto-Lei%20n%20_198_2012_24_08.pdf)</p>
Risk Rating	Specified Risk
Comment or Mitigation Measure	<p>Reginacork selects areas within the Supply Base relevant for its SBE program, which are relatively convenient to assess, because of a clear management situation, for example the availability of management plants (like ZIFs). Reginacork does not buy any wood from wood suppliers without a valid company registration and delivery documentation indicating the place of harvest. The Due Diligence System and the 'Procedure on the legality and origin of raw material' state appropriate control systems. See also indicator 1.2.1.</p>

	Indicator
1.1.3	The feedstock input profile is described and categorised by the mix of inputs.
Finding	<p>As described in previous indicators Primary Feedstock comes mainly from private properties. Reginacork has specialists visiting our suppliers and working on risk assessments and mitigation. By far most resources come directly from the forest. The Sawmills producing feedstock during timber processing, are sources of Secondary Feedstock. The main products provided from sawmill and other timber industry entities are sawdust and chips. Reginacork receives the 'Manifesto' and other legal documents on the origin of wood. Reginacork manages an FSC credit system and is SBP certified. Within the framework of our FSC company evaluation program we assess PEFC suppliers (before we start working with them). The evaluation can result in an FSC CW claim on the resources. There is no specific legislation regulating classification of wood/timber harvested in Portugal in terms of species, quantities or qualities. The fact</p>

	that most of forests are productive and Eucalyptus, Pines and Cork Oak covers 78% of forest land, made that this issue is not perceived as a problem with national wood/timber. Industrial use of Eucalyptus and Pines ensure that they are adequately classified and measured. Felling manifests require identification of species and volumes and are obligatory for every forest species for industrial use. Since the supply chains are short, reliable information regarding the feedstock can be gathered in collaboration with the forest owners and other stakeholders. Thus accurate classification and description of type, species, and categorization into roundwood and residual wood material, and when required, the approximate proportion of roundwood from final felling, in accordance with SBP requirements is possible for Biomass Producers.
Means of Verification	Copy of delivered felling manifest to Forest Authorities (ICNF) for Pinus pinaster used in industrial purposes Invoices Transport/shipping documents, waybills Feedstock input records: document "RCK_06.15.00 Registo de Entrada Madeira".
Evidence Reviewed	Delivery notes, felling manifests, invoices, among other legal documents. Estrategia Nacional das Florestas (https://dre.pt/application/file/66432612); ICNF portal (http://www.icnf.pt/portal/icnf/docref/enf) Inventario Florestal Nacional IFN6, preliminary results (IFN6 - Resultados preliminares.pdf); ICNF portal Decreto lei 174-1988 manifesto corte (https://dre.pt/application/file/374768); ICNF portal(http://www.icnf.pt/portal/icnf/serv/formularios/manif/man-cort-arr-arvor).
Risk Rating	Low Risk
Comment or Mitigation Measure	Checked in the forest and at the gate.

	Indicator
1.2.1	The BP has implemented appropriate control systems and procedures to ensure that legality of ownership and land use can be demonstrated for the Supply Base.
Finding	The Wood Supply Manager knows all plots to be harvested or to be managed and knows in which regions there are no cadastral data / land records. In Portugal, around 97% of forest land is private (including land owned by individuals, communities and corporations). This proportion means that the most part of protected and classified areas are also private lands. Forest land tenure is based on one document (Description of the Land Registry) but several documents are used on the ground level as transitory or incomplete evidence, as the Description on the Land Registry is not updated for all lands. There are, however, regions (53% of territory) where there is a geometric cadastral survey of rural lands (Cadastró Geométrico da Propriedade Rústica) and so there is consistency between spatial and numeric information (DL 172/95). held by tax offices (matriz e secção da Caderneta Predial Rústica da repartição das finanças). In regions where there is no rural geometric cadastre (47% of the territory), the land tenure documents are based only on descriptions of boundaries and communications with neighbors. In case of failures or maintenance, the means are put on the ground in order to solve the situation. These means can be from the company itself or from the company representative of the equipment. In case of Complaint related to court, the person in charge of the company meets at the place of court with all parties involved (seller / claimant or other). When the facts are proven and all parties are heard, the responsible

	<p>person decides to adjust the business according to what happened. The closing of the complaint can be done in two ways: • If the claimant understands the purchase, the remaining portion. That is, a new buying process is opened where one makes the acquisition of what was cut by lapse together with what is standing; • The claimant does not accept to sell the remaining portion. The wood cut is evaluated and paid to the owner considering the occurrence as a payment of damages to the owner; Land use rights and management practices are covered and need to be deemed low risk before the Manifest document is issued to allow forest harvesting. Reginacork does not get involved in issues that must be settled by the suppliers (loggers and forest owners) when they have to ask to the Portuguese Forestry Authorities the permission to harvest, i.e., when it is harvested such type of issues must be resolved. Despite the difficulties and complexities concerning land tenure and management rights (mainly due to the absence of geometric information), there is no significant evidence in Reginacork of disputes or disputes about the issue.</p>
Means of Verification	<p>Suppliers must have an 'Economic operator registration. Reginacork only accepts feedstock delivered with 'Manifest'. Reginacork also checks if the feedstock suppliers fulfil all fiscal and legal obligations. Document of Reginacork 'Procedure on the legality and origin of raw material'. Description on the Land Registry (Descrição na Conservatória do Registo Predial) SBP Framework Supply Base Report Template for BPs Annex 1 Page 9 Content certificate matrix article of tax office (Certidão de teor do artigo de Matriz da repartição de finanças) & land notebook (Caderneta predial) is the fiscal document which confirms taxes payment. Judicial final and unappealable decision (Sentença judicial transitada em julgado). Notarial deed (Escritura notarial). Forest Renting/leasing contract (Contrato de Arrendamento Florestal) For Collective or Comercial entities the extract from the commercial register (Certidão do Registo Comercial) to prove the specific responsibilities of owners/managers/presidents Purchase documents. http://elearning.ipca.pt/1213/pluginfile.php/82971/mod_resource/content/1/sumarios_reais_11_12.pdf.</p>

Risk Rating	Specified Risk
Comment or Mitigation Measure	<p>Reginacork does not buy wood from wood lands, of which the owner rights are unclear. Any unclarity/dispute concerning the ownership of the wood needs to be solved first. For example, areas can become ownerless and abandoned and some could try to take advantage of the situation before the land is impounded by the government. Reginacork does not buy any wood from wood suppliers without a valid company registration, nor from wood lands, of which the owner rights are disputed. Any dispute concerning the ownership of the wood needs to be solved first. Additional investigations are conducted by means of legal document research and extends to, for example, interviewing local stakeholders (owners of neighbouring wood lands)</p>

	<p>and local authorities, whenever:</p> <ul style="list-style-type: none"> • Cadastral data are unavailable; • The land will be impounded by the government; • There are complaints about the land owner, or the harvest operation. <p>In these cases, the internal procedure 'Procedure on the legality and origin of raw material' is activated. The Due Diligence System and the 'Procedure on the legality and origin of raw material' state appropriate control systems. In cases with doubt, mostly due to absent cadastral data, Reginacork decides to double-check if there are no legal issues to the harvest operations. All suppliers must have an 'Economic operator registration'. Reginacork only accepts feedstock delivered with 'Manifest' or other document that proves its origin. Reginacork also checks if the feedstock suppliers fulfil all fiscal and legal obligations. Reginacork applies an additional internal procedure on the acquisition of feedstock called: 'Procedure on the legality and origin of raw material'. The following requirements are met:</p> <ul style="list-style-type: none"> • Identification of the plot / area ; • Identification of the owner (citizen card); • Proof of the relationship between the seller and the land in question; • Formalization of the business through a purchase and sale agreement between the parties; Mapping; • Invoice and bankpayment. • Check owner of bank account. • Caderneta Predial Rustica is demanded. <p>In addition to the information collected, at least one site visit is always conducted with the owner or his representative, where information is taken about:</p> <ul style="list-style-type: none"> • Type of vegetation / species; • Ground boundaries / Confrontations; • Accesses. <p>This procedure also indicates the resolution of grievances and disputes, including those relating to tenure and land use rights to forest (or land) management practices and working conditions. Whenever any of the above occurs, the technical responsible is contacted and called to the location whenever necessary. If there are unsolved issues related to the feedstock the procurement does not take place.</p>
--	---

	Indicator
1.3.1	<p>The BP has implemented appropriate control systems and procedures to ensure that feedstock is legally harvested and supplied and is in compliance with EUTR legality requirements.</p>
Finding	<p>Forest biomass feedstock definition on Portuguese legislation is included on legal framework created both for dedicated energetic generation plants and for residues purposes. In the first case definition forest biomass, consists of the biodegradable fraction products, waste and residues from biologic origin from the forest or other plantations. For the residues purposes forest biomass is the vegetable matter from forestry and forestry waste, only including the material resulting from the improvement operations, including thinning and pruning, fuel management and harvesting of forest stands, as the branches, tree-tops, stumps, leaves, roots and bark. No permit is required for logging activities, including normal commercial silvicultural harvesting, final cuts and others. Only a harvesting written notice (manifesto) is obligatory for timber and cork for industrial use, submitted to forest authorities (ICNF) up to 30 days after the felling/extraction operation. Beside the specific operations listed above, a National Action Plan for Control of Pine Wilt Disease (NMP in PT) <i>Bursaphelenchus xylophilus</i> and its vector insect <i>Monochamus galloprovincialis</i> is in place. This mostly focuses in our case is <i>Pinus pinaster</i> (23% of all forest areas) but applies to all other host conifers (<i>Abies</i> spp., <i>Cedrus</i> spp., <i>Larix</i> spp., <i>Picea</i> spp., <i>Pinus</i> spp, <i>Pseudotsuga</i> spp., <i>Tsuga</i> spp) – with these species covering 8% of forests. For these species there is obligation of previous communication of any felling and/or transportation of wood affected by pest. This documentation (phytosanitary manifest) also must accompany material until the arrival to industrial processing facilities. Since the onset of the EUTR in 2013 enterprises classified as 'Operators' under the regulation. so we have been the register for our activities on a Digital</p>

	<p>Platform managed by the Forest Authorities (ICNF) http://www.icnf.pt/portal/florestas/fileiras/reg-op#reg. In addition to the register, the company has a due diligence system in place for each wood/timber acquisition, which includes procedures for access to information, risk assessment and risk mitigation. To start any operations in the forest, the document named Manifest is filled and submitted to Direcção Geral dos Recursos Florestais (General Management of Forest Resources). For all species, Reginacork receives documents on every transport that takes place in the chain from the raw material supplier to Reginacork. The transport documents state: the name and address of the operator and the sender or receiver, the name and quantity/volume of the shipped product, the place of provenance of the raw material and the date of the shipment. The person responsible for the purchase of the raw material is constantly accompanying the loggers and ensuring these issues. Reginacork also has the contract agreement that is made with the forest owner which defines the plots where to operate. The Competent Authority in Portugal for ensuring implementation of the EUTR is Institute for Nature Conservation and Forests (ICNF). The enforcement authority is the National Republican Guard (GNR) which conducts enforcement according to ICNF procedures. Since the start of 2015 a far-reaching regime of inspections has begun. From January 2015 to April 2016 ICNF has conducted 113 inspections with no contraventions, included Reginacork. Also for the same period GNR has conducted 265 inspections with one contravention. As there is no permit required for ordinary forest harvesting, all attention is focused, in our case, on referred exceptional cases: • Conversion from forest to plantations for areas larger than 350 ha or other uses for areas greater than 50 ha; • The National Action Plan for Control of NMP (Pine Wood Nematode) applies to all conifers and includes a strict phytosanitary plan which requires up-front registration of all operators and notification to authorities, prior to commencement of harvesting, transport and processing of wood (some of cuttings detailed on Action Plan are obligatory).</p>
<p>Means of Verification</p>	<p>DDS Manifest; Register in ICNF platform; Written permit referring applicable legislation in all exceptional cases referred above; Operator registry and previous notification in cases of all conifers because of Nematode Pine Plan NMP; EUTR Operator Registry: • Information about the wood/timber products which shall include quality, quantity, the supplier, origin country, and conformity with national legislation; • Risk evaluation- of the illegality of the timber by operator of the supply chain, based on the collected information. • Risk minimization - by additional information, verifications if the evaluation reveals specified risks.</p>

Risk Rating	Low Risk
Comment or Mitigation Measure	See 1.1.2, 1.2.1, and 1.4.1. Reginacork checks legality. The EUTR covers also wood placed on EU market from Portuguese forests.

	Indicator
1.4.1	The BP has implemented appropriate control systems and procedures to verify that payments for harvest rights and timber, including duties, relevant royalties and taxes related to timber harvesting, are complete and up to date.
Finding	In Portugal it is not applicable payments for harvest rights and timber, including duties, relevant royalties and taxes related to timber harvesting such as stumpage fees and other volume based fees. Only taxes related to timber harvesting are applicable to all economic activities such as value added taxes (VAT) and income taxes (IRS and IRC). VAT (IVA) taxes: A normal tax rate of 23% VAT is applied to sale of wood. In special cases, a VAT reduction to 6% can be applied to the owner of 'standing wood' or 'standing stock sales'; or even VAT exemption if the owner is an agriculturalist or silviculturalist. Invoices must be issued by the seller, but self-invoicing by the buyer may occur in exceptional circumstances if some conditions are met (previous agreement, data conformity, etc). As no specific evidence of irregularity has been identified in relation to payment of VAT, this requirement is considered Low risk. The payment of VAT is a simple requisition that is easy to verify and legally undertake by both entities (seller and buyer). The exceptional regimes of reduced taxes or exemption are in place to include the cases of forest owners with special profiles as agriculturalist or silviculturalist. Income taxes (IRS & IRC): Income taxes are applied according to individual or collective fiscal laws. It was not found any specific evidence of irregularities about income taxes related to harvest companies. Fiscal Authorities are Autoridade Tributária, which makes joint inspections on roads together with GNR- Guarda Nacional Republicana.

Risk Rating	Low Risk
Comment or Mitigation Measure	Business between the forest producer and purchaser has some risk related to tax evasion, but these are dealt with by the general procedures at Reginacork to comply with legality. Reginacork checks the identity of wood suppliers and if their bank account is related to them. Reginacork only pays via the bank. Reginacork communicates with suppliers that they need to pay taxes. Any indication to tax debts or corruption, is sufficient reason to not cooperate with a raw material supplier.

	Indicator
1.5.1	The BP has implemented appropriate control systems and procedures to verify that feedstock is supplied in compliance with the requirements of CITES.
Finding	There are no trees in Portugal belonging to CITES annexes. Also it was not found any direct effect of harvesting or forest management over CITES listed species.
Means of Verification	List of purchased species.

Comment or Mitigation Measure	---
-------------------------------	-----

	Indicator
1.6.1	The BP has implemented appropriate control systems and procedures to ensure that feedstock is not sourced from areas where there are violations of traditional or civil rights.
Finding	<p>Portugal and Portuguese forest sector is not associated with violent armed conflict, including that which threatens national or regional security and/or linked to military control. The country is not covered by a UN security ban on exporting timber or any other international ban on timber export, also there are not individuals or entities involved in the forest sector that are facing UN sanctions. Portugal is well positioned at all international reports: • Corruption Perception Index scores 63 meaning low perceived level of corruption; • Worldwide Governance Indicators (WGI) from 73.3 to 84.13 (1-100points)</p> <p>The WGI report six aggregate governance indicators for over 200 countries and territories over the period 1996-2014, covering i) Voice and Accountability, ii) Political Stability and Absence of Violence/Terrorism, iii) Government Effectiveness, iv) Regulatory Quality, v) Rule of Law, and vi) Control of Corruption. On the other side Portugal (including human rights, illegal logging , forest and timber) is not listed in alarming reports or indexes such as: • Committee to Protect Journalists Impunity Index; • Human Rights Watch; • Global Witness • Chattham House • Amnesty International There are not indigenous or traditional people in Portugal that could claim traditional rights to lands, forests and other resources, based on long established custom or traditional occupation and use. This are potential issues that loggers and forest owners need to address when asking for a harvesting permission. This point is covered before the manifest document is issued. Reginacork is checking this document and ensuring they are buying from certified and licensed suppliers. Instead, there are rights to pass in public roads and ways, across the coast or rivers. In Portugal getting in forest lands is not considered invasion even on private properties, and it is common the use of wild products by communities (mushrooms, asparagus, snails, besides fishing on public waters). Reginacork is FSC certified and listens to the people living in the surroundings of the forest areas. Reginacork is always prepared to solve any problem in a pleasant way and respects people who make use of their (traditional) rights.</p>

Risk Rating	Low Risk
Comment or Mitigation Measure	---

	Indicator
2.1.1	The BP has implemented appropriate control systems and procedures for verifying that forests and other areas with high conservation value in the Supply Base are identified and mapped.
Finding	The important HCV areas critical to conservation are designated as protected and classified areas at national or EU level (Natura 2000), there are very likely a large number of smaller areas or biotopes important to biodiversity or as classified priority species and habitats could be unidentified. HCV 1 – Species diversity: concentrations of biological diversity including endemic species, and rare, threatened, or endangered species that are significant at global, regional, or national levels. i) Classified areas: The total classified area protected by the Rede Nacional de Áreas Protegidas (RNAP) and the Rede Natura2000 covers around 20 per cent of Portugal’s continental territory. Classified areas comprise RNAP protected areas, sites from the national list [which includes sites of community importance (SICs)] and the Zonas de Protecção Especial para Aves (ZPE) of the Natura 2000 network. Municipal protection areas must also be considered. Other classified areas are also protected by

international commitments agreed upon by the Portuguese state (e.g. Ramsar Convention sites, biogenetic reserves, biosphere reserves). Although not included in classified areas, other areas come under this umbrella, such as Important Bird Areas (IBAs), sites of international importance for the conservation of birds on a global scale. (<http://www.icnf.pt/portal/naturaclas/cart>). ii) Endangered species according to the classification adopted by the International Union for the Conservation of Nature (IUCN) to endangered species: • Critically endangered (CR) • Endangered (EN) • Vulnerable (VU). • Protected species within the legal conservation instruments in force in Portugal Relevant information: • Habitat and Birds Directives; • CITES • Bern Convention • Bonn Convention • Red Book of Vertebrates from Portugal • Red book and Atlas of Bryophytes • <http://www.icnf.pt/portal/naturaclas/patrinatur/especies> iii) Endemic species: The Mediterranean basin, in which Portugal is found, contains around 25,000 species of plants, of which 50 per cent are endemic to the region. Of almost 4,000 species of flora listed for Portugal (continental, Azores, and Madeira), around 450 are lusitanian endemisms (444 in total; 143 on the continent, plus 76 from the Azores, 158 from Madeira, and 67 from Macaronesia), and 346 are endemic to the Iberian Peninsula. 3,314 species of flora are listed for the continent, 1,006 in the Azores archipelago, and 1,233 in Madeira. This is the region that shelters the highest number of endemisms (species that do not exist elsewhere) – 157 in all. In the Azores the number reaches 78, while on the continent it is 150. As for invertebrates, information is scarce, but there are statistics for insects: so far, 402 taxa have been registered (369 species and 33 subspecies) which are recognized as lusitanian endemisms. iv) Critical seasonal use areas including critical areas of refuge, breeding or migration routes in Portuguese territory: Fauna species may use different types of habitat depending on their life cycle and the season. These habitats can be critical for their importance in the reproductive season or for the availability of food in certain seasons. This designation focuses on the importance of these areas for fauna. Digital mapping information from the Manual das Linhas Eléctricas [Manual of Electric Lines] (ICNB 2008) is also used, for reference purposes only, as its scope is limited in this field. This identifies: • Autumnal bird migration corridors in south-west Alentejo and the Vicentina coast; • Zones of concentration and passage for steppe birds (great and little bustards); • Reproduction areas for birds of prey with threatened status; • Concentration of winter birds in wetlands; • Shelters for bats, considered important at a national, regional, and local level. • As for invertebrates, information is scarce, but there are statistics for insects: so far, 402 taxa have been registered (369 species and 33 subspecies) which are recognized as Lusitanian endemism.

HCV 2 – Landscape-level ecosystems and mosaics: Intact forest landscapes and large landscape-level ecosystems and ecosystem mosaics that are significant at global, regional or national levels, and that contain viable populations of the great majority of the naturally occurring species in natural patterns of distribution and abundance. • Cork oak and holm oak formations occurring in Portugal in the heathlands of the Tagus and Sado (cork) and Guadiana Valley (oak) under the form of woodlands or montados. HCV 3 – Ecosystems and habitats: rare, threatened, or endangered ecosystems, habitats or refugia i) Habitats Directive (2007-2012) Covers habitats listed in the Habitats Directive (Annex I) which, in the last national Habitats Directive report (2007–2012), were listed in categories (U1) – unfavourable inadequate – and (U2) – unfavourable bad. ii) Natura 2000 database Natura2000's sectorial plan is the main source of information used to identify habitats in classified areas. In the case of non-classified areas, the Habitats Directive implementation reports can be consulted for information on habitat conservation (favourable, unfavourable inadequate, unfavourable bad). iii) Portugal approved its ratification of the Convention on Biological Diversity (CBD) via DL no. 21/93, dated 29 June, which became effective in our country on 21 March 1994. The Fifth National Report to CBD had as its main objective a review of implementation of the Convention and an assessment of how far we had come in achieving CBD objectives and the Aichi Biodiversity Targets contained in the Strategic Plan for Biodiversity 2011–2020. It also contributed to the development of the Global Biodiversity Outlook report and the review of the fulfilment of the EU Biodiversity Strategy for 2020. The

report covers the state and tendencies of biodiversity and detected threats, reporting on actions taken towards fulfilling the Aichi Biodiversity Targets and finally sets out, based on experience, topics most deserving of attention in order to achieve a more adequate and broad-reaching implementation of the CBD's COP (Conference of Parties) decisions in Portugal.

HCV 4 – Critical ecosystem services: basic ecosystem services in critical situations, including protection of water catchments and control of erosion of vulnerable soils and slopes. forests located in critical areas in river basins, such as floodplains and sloping areas, as defined and mapped in REN-National Ecological Reserve.

HCV 5 – Community needs: Sites and resources fundamental for satisfying the basic necessities of local communities or indigenous peoples (for livelihoods, health, nutrition, water, etc.), identified through engagement with these communities or indigenous peoples.

HCV 6 – Cultural values: sites, resources, habitats, and landscapes of global or national cultural, archaeological, or historical significance, and/or of critical cultural, ecological, economic, or religious/sacred importance for the traditional cultures of local communities or indigenous peoples, identified through engagement with these local communities or Indigenous Peoples.

i) World Heritage (UNESCO) Sites identified as World Heritage by UNESCO. In Portugal there are 15 sites identified (<http://www.patrimoniocultural.pt/pt/patrimonio/patrimonio-mundial/portugal> or <http://www.rmp.pt/#!sitios/cihc>), of which only two are designated as outstanding natural landscapes ('Paisagem Cultural de Sintra', around 900ha, on the Portuguese mainland, and the 'Floresta Laurissilva na Madeira', on the island of Madeira, covering 15,000ha). The Iberian Risk Assessment also identified rocky landscapes such as the Vale de Foz Côa [Foz Côa Valley], the Douro slopes, and the landscape of Pico island, places that, analysed more closely, are not part of the forestry sector – see the results of the meeting of the working group for category 3 (5 July 2016). Currently, there are other sites proposed for Portugal under assessment by UNESCO (<https://www.unescoportugal.mne.pt/pt/temas/proteger-o-nosso-patrimonio-e-promover-a-criatividade/patrimonio-mundial-em-portugal>). These are not yet included here.

ii) Cultural heritage (Law no. 107/2001, dated 8 September) In Portugal there are specific governmental bodies to manage cultural heritage: the General Directorate of Cultural Heritage for the Portuguese Mainland (<http://patrimoniocultural.pt/en/>); Directorate of Services of Cultural Heritage for the Island of Madeira (<http://cultura.madeira-edu.pt/agendacultural/CulturalHeritage/DSPC/tabid/939/language/en-US/Default.aspx>); and the Regional Directorate of Culture for the Azores Islands (<http://www.azores.gov.pt/Portal/en/entidades/srec-drcultura/?lang=en> and <http://www.iac-azores.org/>). Among others, these bodies are responsible for: managing the architectural and archaeological built heritage in urban and rural areas, including conservation works in monuments under our care; managing the national museums, World Heritage monuments and museum collections; studying, researching, and disseminating heritage-related information; conserving and restoring movable heritage assets as well as researching, disseminating results, and raising awareness about heritage protection issues.

iii) Classified groves (Law no. 53/2012, dated 5 September) National legislation that identifies and protects outstanding grove (arboreta) (<http://www.icnf.pt/portal/florestas/Arvores.qry?start:int=80&Distrito=&Concelho=&Freguesia=&Processo>). The main source of information within this attribute is the application report of the Habitats Directive (2007-2012) as well as the description list of every habitat identified in the Annex 1 of Habitats Directive in Sectorial Plan of the Natura2000 network. Other cartographic information of HCV is included on open GIS like http://www.habeas-med.org/webgis/pt_en/ and <http://epic-webgis-portugal.isa.ulisboa.pt>.

Conclusion HCV 1 – Specified risk The scope of RNAP and SNAC is the assessment of large areas with significant biodiversity values, meaning that the identification of threats and pressures to attributes, as well as monitoring activities are, typically, performed at a macro scale. The identification of precise HCV attributes might not fall under the scope of these assessments, so specified risk is considered. Outside SNAC and RNAP, where less information is available, the risk is, thereby, specified.

HCV 2 – Low Risk It is considered that HCV2

	<p>attributes are well identified and mapped. HCV 3 – Specified Risk Extra effort is needed to identify and map these values. Internet sources, as well as the situation on the ground need to be studied. See indicator 2.1.2. and 2.2.3 HCV 4 & 5 – Specified risk Extra effort is needed to identify and map these values. Internet sources, as well as the local situation need to be studied. This is a specified the risk on private, communitarian, and public forest areas not managed by ICNF, subject to clear cutting at dimensions above to the maximum area indicated for each region by the Regional Forestry Management Plan (PROF). There are no indigenous people in Portugal, but in it is important to evaluate the interests of the (local) population and social-economic functions of the forests and woodlands (including agricultural or municipal functions). Building fences around forests is most of the time undesirable. See indicators 2.2.2, 2.2.3, 2.2.6, 2.4.1 and 2.5.1 (and 2.6.1 as ‘safety net’) HCV 6 – Low risk Significant cultural features created intentionally by humans are identified and sufficient buffers are applied, since the criteria for identifying HCV 6 for Portugal are based on international or legal frameworks that already foresee the safeguards needed to protect/maintain the cultural values identified.</p>
<p>Means of Verification</p>	<p>Reginacork’s Evaluation of the risks and possible impacts of harvesting operations (EoR) • Field studies suppliers • Harvesting operation maps Reginacork and feedstock suppliers • Internet research • GIS maps of HCV areas. • Interviews • Priority Classified Habitat and species catalogue. • FSC and PEFC certificate The pellets are at FSC CW and SBP-controlled biomass. Our specialists check the harvesting areas and assure protected regions are not cut.</p>

<p>Risk Rating</p>	<p>Specified Risk</p>

<p>Comment or Mitigation Measure</p>	<p>The control system for feedstock, which also includes regular inspections of suppliers, is duly implemented. All suppliers have to comply with the laws in force, which are supervised by the Tax Authority and the ICNF (Please see the file 'Plano Regional de Ordenamento Florestal' 'Documentation point 4 'cartografia síntese' (ICNF) for each region). Some HCV areas are designated as protected and classified areas at the national or EU level (Natura 2000). There are also smaller areas or biotopes important to biodiversity, or classified as priority species' habitats. Reginacork identifies and maps of areas with high conservation values (HCVs). HCV 1, 3, 4, and 5 were assessed to have a specified risk. Extra effort is needed to identify and map these values. Internet sources, as well as the local situation needs to be studied. Below the main sources of information, used to prepare the identification of these values for our harvesting teams. The feedstock suppliers evaluate every plot before the harvesting operations begin. Reginacork inspects the suppliers and harvesting areas. The habitats and species vulnerable to forestry operations are identified within the scope of Reed Natura2000 and Habitats and Birds Directive reports. HCV 1 – Species diversity: > Classified areas: http://www.icnf.pt/portal/naturaclas/cart > Protected area plans: http://www.icnf.pt/portal/naturaclas/ordgest/poap > Endangered species: http://www.icnf.pt/portal/naturaclas/patrinatur/especies > Endemic species: http://naturdata.com/index.php?option=com_content&view=article&id=78&Itemid=60 > Digital mapping information from the Manual das Linhas Eléctricas [Manual of Electric Lines] (ICNB 2008) > Important Bird Areas of Portugal at: http://ibas-terrestres.spea.pt/ > Regional Forest Plans (PROF): http://www.icnf.pt/portal/florestas/profs HCV 3 – Ecosystems and habitats: > Habitats Directive (2007-2012) > Rede Natura 2000 database: http://www.icnf.pt/portal/naturaclas/rn2000 > Important Bird Areas of Portugal at: http://ibas-terrestres.spea.pt/ > Convention on Biological Diversity (CBD) via DL no. 21/93, dated 29 June HCV 4 – Critical ecosystem services & HCV 5 – Community needs: > Habeas-Hotspot Areas for Biodiversity and Ecosystem Services http://www.habeas-med.org/webgis/pt_en/ > Forests located in critical areas - defined and mapped in REN-National Ecological Reserve. Steps taken to guarantee the protection of HCVs: • Study publicly available and other information regarding the plots were harvesting operations are planned and their surroundings; • Inform harvesting teams and feedstock suppliers on found results on possible risks; • Onsite assessment of the plots and their surroundings prior to harvesting, measures are taken when the possible risks related to the plot prove to be applicable; for example, when habitats are found; • Check possible local interests, future plans regarding the land, and the complaint management for wood suppliers; • Evaluation of the risks and possible impacts of harvesting operations; • Development of adaptations to the harvesting plans, if needed.</p>
--------------------------------------	--

	Indicator
<p>2.1.2</p>	<p>The BP has implemented appropriate control systems and procedures to identify and address potential threats to forests and other areas with high conservation values from forest management activities.</p>
<p>Finding</p>	<p>HCV 1 – Specified Risk The scope of RNAP and SNAC is the assessment of large areas with significant biodiversity values, meaning that the identification of threats and pressures to attributes, as well as monitoring activities are, typically, performed at a macro scale. The identification of precise HCV attributes might not fall under the scope of these assessments, so specified risk is considered. Outside SNAC and RNAP, where less information is available, the risk is, thereby, specified. Several legal instruments protect areas of significant</p>

biological diversity: planos de ordenamento de áreas protegidas (POAP), planos regionais de ordenamento florestal (PROF), planos directores municipais [town planning] (PDM), plano de gestão florestal (PGF), and, in the case of classified areas, a programa de gestão da biodiversidade [biodiversity management programme] (PGB). Regarding the establishment of projects and programmes aiming to enhance the conservation status of HCV, the LIFE Programme has facilitated the development of a series of projects in Portugal (<http://ec.europa.eu/environment/life/project/Projects/index.cfm?fuseaction=home.getDocs>), many of which permit contracts with owners as good conservation management practice, support and awareness-raising for owners and schools, and also vertical signs of species' territorial areas. A series of documents is also produced, from simple brochures to manuals of good practice (an example being the conservation manual for the Bonelli's eagle and the good forestry and hunting practice manual). Some projects include action plans for species conservation. Most projects have as their objective the conservation of potential HCV 1 species, being carried out by Natura2000 Network. Some NGOs, such as Sociedade Portuguesa para o Estudo das Aves (SPEA) [Portuguese Society for the Study of Birds]), have formed working groups to monitor species, such as the Bonelli's eagle working group (GTAB) and the night birds working group (GTAN). Furthermore, various good practice manuals, leaflets and other relevant information sources are available in the public domain, published by different institutions.

HCV2 – Low risk The regulation implemented in Portugal on oak and holm trees and stands, includes a comprehensive legislative framework with a legal action planning and project but also cuttings protection. This legislation also meet forest management measures themselves related to intensity of exploitation, such as the stripping and pruning. This regulation is relatively well established and disclosed have being assimilated by the various agents involved as owners, managers, and operators. Also the planned forest management and the proper certification of sustainable forest management expanded in Portugal in recent years is currently counting about 236 000 hectares certified forests entering the cork and holm oak species (is not robust statistics on the certified specific area with cork oak stands). Following several surveys on the fragilised state of cork and holm oak stands, there were also developed various processes to improve forest management practices, which were disclosed by the various entities involved. This includes a variety of contents and formats such as codes of good cork forest practices but also pest and disease identification guides. More recent investment lines have been created supported by EU grants to assist owners and managers in pest monitoring of cork and holm oak stands (Operation 8.1.3 - Prevention of forest against biotic and abiotic agents) and for health recovery and restoration of forest stands of cork oak (Operation 8.1.4 - forest Restoration affected by biotic and abiotic agents or catastrophic events). The most current detailed results achieved by management and improvement actions on forest stands of are not fully known, since the full values of the last national inventory (IFN6) are still missing, however it is known that the class of 'wooded area with cork oak' had an increase of 6% from 1995 to 2010, and holm oak has decreased 3% in the same period.

HCV 3 – Specified risk Information about threats of management activities to this designation can be found in ICNF information, namely in the sectorial plan of Natura2000 and in the Third National Application Report of the Habitats Directive (2007–2012). Portugal publishes graphics of threats to Portuguese habitats and species (Continent+Azores+Madeira) <http://www.icnf.pt/portal/naturaclas/rn2000/resource/docs/rel-nac-07-12/docs/nat-summ-pt>, as required by arts. 12 and 17 of the report. The Natura 2000 network database was updated in 2015 and it contains relevant information about the assessment of each habitat for each Common Importance Site. Furthermore, Portugal approved its ratification of the Convention on Biological Diversity (CBD) via DL no. 21/93, June 29th, which became effective on 21 March 1994. The Fifth National Report to CBD had as its main objective a review of implementation of the Convention and an assessment of how far we had come in achieving CBD objectives and the Aichi Biodiversity Targets contained in the Strategic Plan for Biodiversity 2011–2020. It also contributed to the development of the Global Biodiversity Outlook report and the review of the fulfilment of the EU Biodiversity Strategy for 2020. The

	<p>report covers the state and tendencies of biodiversity and detected threats, reporting on actions taken towards fulfilling the Aichi Biodiversity Targets and finally sets out, based on experience, topics most deserving of attention in order to achieve a more adequate and broad-reaching implementation of the CBD's COP (Conference of Parties) decisions in Portugal. The vertebrate species identified as threatened are listed and described in the Redbook of Vertebrates from Portugal. Similar assessment has been done for Bryophytes in the Redbook of Bryophytes. A study aimed to identified and list the threatened flora is being develop at this moment. The habitats and species vulnerable to forestry operations are identified within the scope of Reed Natura2000 and Habitats and Birds Directive reports.</p> <p>HCV 4 & HCV 5 – Specified Risk There are threats to forests located in critical areas in river basins, such as floodplains and steep areas, and aquifers as defined and mapped in REN- National Ecologic Reserve. Many of these threats include the conversion for forest plantations or other non-forest uses, and are addressed at following indicator 2.1.3. It has been identified very negative effects as a consequence of large forest fires on the river basin, affecting qualitative and quantitative hydrological flows in the following periods. In such cases the forest authorities (ICNF) develop and promote specific plans for the recovery of burned areas with precise information on the destinations of the timber. There are also threats of lesser magnitude caused in private forests, arising from inadequate operations of harvesting and / or maintenance. These operations include tools, interventions and inadequate intensity to the sensitivity of soils and vegetation in these critical areas to the protection of floods. However, the reduced scale of the most forest operations contributes to the reduction of the magnitude of the identified risks.</p> <p>HCV 6 – Low Risk The criteria for identifying HCV 6 for Portugal are based on international or legal frameworks that already foresee the safeguards needed to protect/maintain the cultural values identified. At the same time, it is considered that the values are legally recognized and enforced.</p>

Risk Rating	Specified Risk
Comment or Mitigation Measure	<p>The control system for feedstock, which also includes regular inspections of suppliers, is duly implemented. All used material is traceable to its origin through the harvest manifests and transport guides. All suppliers have to comply with the laws in force, which are supervised by the Tax Authority and the ICNF (Please see the file 'Plano Regional de Ordenamento Florestal' 'Documentation point 4 'cartografia síntese' (ICNF) for each region). Some HCV areas are designated as protected and classified areas at the national or EU level (Natura 2000). There are also smaller areas or biotopes important to biodiversity, or classified as priority species' habitats. Reginacork identifies and addresses potential threats to forests and other areas with high conservation values (HCVs). HCV 1, 3, 4, and 5 were assessed to have a specified risk. Reginacork ensures:</p> <ul style="list-style-type: none"> • mapping of the harvesting plot, • owner rights, • harvesting according to the technical rules sustainable forest management, • best silvicultural practices, respecting environmental and safety rules, • cleaning of waste from plantations • tree species (no genetically modified trees) <p>The feedstock suppliers evaluate every plot before the harvesting operations begin. Reginacork inspects the suppliers and harvesting. Reginacork keeps records of field inspections and monitoring results.</p> <p>HCV 1 – Species diversity There is a specified risk that forest operations on private and communitarian grounds and public areas not managed by ICNF could harm species diversity. Species diversity is evaluated and recorded before harvesting operations commence. Caution and best practises are applied. Special attention is given to the National System of Classified Areas (SNAC) and to the Important Bird and Biodiversity Areas (IBAs). See also below, indicator 2.2.4 HCV 3 – Ecosystems and habitats There is a specified risk that forest operations on private and communitarian grounds and public areas not managed by ICNF could harm ecosystems and habitats. In these situations, the supplier Reginacork demands to evaluate the environmental impacts (on Ecosystems and habitats) of the forest operations (before the forest operations commence). Caution and best practises are applied. The Plant Manager of Reginacork checks the environmental assessment and does field inspections. The checks and inspections are recorded. The habitats and species vulnerable to forestry operations are identified within the scope of Reed Natura2000 and Habitats and Birds Directive reports. See also below, indicator 2.2.3. HCV 4 – Critical ecosystem services & HCV 5 – Community needs This is a specified the risk on private, communitarian, and public forest areas not managed by ICNF, subject to clear cutting at dimensions above to the maximum area indicated for each region by the Regional Forestry Management Plan (PROF). This point is evaluated and recorded before the forest operations commence. Caution and best practises are applied. Clear cuts are reduced to the maximum size indicated in the PROFs, or even further, if the environmental aspects, such as hillslopes, require special attention. There are no indigenous people in Portugal, but in it is important to evaluate the interests of the (local) population and social-economic functions of the forests and woodlands (including agricultural or municipal functions). Building fences around forests is most of the time undesirable. See above indicator 2.1.1. See below, indicators 2.2.2, 2.2.3, 2.2.6, 2.4.1 and 2.5.1 (and 2.6.1 as 'safety net').</p>

Indicator

<p>2.1.3</p>	<p>The BP has implemented appropriate control systems and procedures for verifying that feedstock is not sourced from forests converted to production plantation forest or non-forest lands after January 2008.</p>
<p>Finding</p>	<p>The majority of the present forest cover have developed from afforestation activities of Pinus Pinaster and Eucalyptus Globulus. Thereby, forest areas considered as primary forest, as is published by FAO, account for around 0.8% of overall forest cover. Furthermore, the overall dynamics of the Portuguese forest cover is not promoted or supported by the demand of biomass. Simultaneously, the development of forest energy crops is not permitted in Portugal, through several legislation limitations, namely the mandatory previous authorization for premature final cut of eucalyptus stands (Law-decree nº173/88 from May 17th), regulations for the introduction and environmental control of non-indigenous species (Law-decree nº565/99 from December 21st) and mainly the mandatory previous authorization for afforestation and reforestation activities using short rotation crops (Law-decree nº175/88 from May 17th). We can also conclude that the remains of the forest ecosystems that would have survived this destruction will be concentrated in the Fundamental Nature Conservation Network (RFCN) (defined by Decree-Law no. 142/2008, amended by Decree-Law no. 242/2015 dated 15 October) and made up of the Sistema Nacional de Áreas Classificadas [National Classified Areas System], which incorporates the central areas of nature conservation and biodiversity: i) RNAP; ii) SICs and ZPEs of the Natura2000 network; iii) any other areas classified under the umbrella of international commitments agreed upon by the Portuguese state; and areas of continuity: i) REN; ii) RAN iii) DPH (public hydric domains), safeguarded by the respective legal regulations. FAO's Global Forest Resources Assessment of 2010 [2] shows the following data regarding Portuguese forest area: • 37% of areas are defined as permanent forest • 20% of the forest is within protected areas • Primary forest only represents 1% • Other naturally regenerated forest just 75% • Planted forest 25%. Altering land cover in the protected areas is prohibited by Article 43 of Decree-Law no. 242/2015, as is the disturbance or destruction of threatened species and their habitats, under Article 44. As far as conversion to forest plantations is concerned, the provisions of Decree-Law no. 96/2013, 19 July, apply to the whole of the continental territory. This establishes the legal framework, for the whole of the continental territory, to which actions of afforestation and reforestation of forest species (RJAAR) are subject. However, any planting/replanting of forest species, independently of the area of intervention, that alters the dominant species previously installed (including the conversion of natural forest to plantations) is subject to advance authorization by the ICNF. It's important to highlight that the article nº9 of RJAAR defines that if an intervention area is situated inside the National Ecologic Reserve, a consult must be addressed to the CCDR as well as the related municipality. The article nº10 defines the factors that should be taken into account in the decision making process including protection of forest against forest fires, hydric related issues, biodiversity and habitat protection, among others. There are 135 Forest Producers Organizations registered on ICNF data base [3], whose offer multiple services, such as the preparation and implementation of Forest Management Plan, creation and management of Forest Intervention Zones, promotion of forest best practices, management of forest intervention teams, among others. As far as conversion that is not for agriculture or forestry is concerned, Decree-Law no. 139/89 is applicable to all Portuguese territory, and establishes protection measures for natural landscape, arable soil, and plant cover. These actions are subject to prior licensing by the municipal council. There is also specific protection legislation for: • Cork and holm oak (D-L no. 169/2001, amended by D-L no. 155/2004 of 30 June); • Riparian vegetation (Law 58/2005 and Law 54/2005); • Holly (Decree-Law no. 423/89). The latest RJAAR informative application note [3] summarizes the main points in this legal regime, including that actions of afforestation and reforestation are to be authorized by the ICNF, approved for public funding support</p>

	<p>programmes, decided upon by environmental impact reviews or environmental incidence assessments, and authorized or carried out by the ICNF, in properties managed by the same. 15% of the reforestation activities comprising the change of species, in the period of assessment, consisted on Pinus Pinaster converted to Eucalyptus. 4% of the referenced activities comprise the plantation of Eucalyptus on areas occupied by other, non-specified, species. The Minister Council from March 21st 2017, approved a law proposal that reviews the Legal Regime of the Arborization and Reforestation Actions [RJAAR] blocking the expansion of the eucalyptus plantation area, allowing new plantations only as compensation for areas previously occupied by eucalyptus and currently abandoned, being mandatory that the areas of previously occupied by this species shall be cleaned and in condition to be used for another agricultural or forestry activity. Risk Conclusion: Specified risk. • Conversion of forest cover is possible in Portugal, although previous authorization by ICNF is mandatory. • Several legal mechanisms and monitoring practices are put in place in order to control forestry activities in sensitive areas, comprising protected tree species. • The exotic tree species most relevant in Portugal is the Eucalyptus Globulus as is described above. The area of Eucalyptus settlements is constrained and thereby, conversions from other species will not be possible. • The change of land use is limited.</p>

Risk Rating	Specified Risk
Comment or Mitigation Measure	<p>There is a specified risk that this indicator is not met. There are no assurances, new eucalyptus plantations from after Jan. 2008 are not already maintained or harvested. First (maintenance) cuts are done after 8 years and the present forest fires result in instant harvesting of plantations. After forest fires can be difficult to assess if the whole area was an eucalyptus plantation in the past, or not; especially in areas without cadastral data. Besides, poplar and other tree species can be considered a plantation and the new law on respriting plantations only covers Eucalyptus. Reginacork considers all pine stands as forests and eucalyptus and poplar stands as plantations. Reginacork checks if forests have been changed to (eucalyptus) or Poplar plantations after 2008. When a eucalyptus or and Poplar plantation is cut the history of the plantation is investigated. First the age of the plantation is determined. If could be form after Jan. 2008, the land owner and/or residents are questioned and the plot is searched for old tree stumps. The results are reported in the 'Evaluation of the risks and possible impacts of harvesting operations'. Reginacork always demands its 'Evaluation of the risks and possible impacts of harvesting operations', which covers these points. The fulfilment of the evaluation is fixed in the Feedstock Supplier Declaration. Reginacork checks the evaluation of its suppliers and inspects harvesting plots.</p>

	Indicator
2.10.1	Genetically modified trees are not used.
Finding	<p>In Portugal there is not a specific legal framework for GMO trees, but for all vascular plants. This legislation doesn't prohibit commercial use of GMO plants which is legal in the country since 1999. However, only corn (maize) is cultivated (around 6% of the total production). It hasn't been found any recent trial of GM trees in the country. Only related notice was from 1997 when Stora Enso trialed a modified variety of Eucalyptus globulus, which was concluded on 2001. The company (Stora Enso) is no longer in Portugal, but is still an industrial global pulp and paper player with interests in GMO. A low risk conclusion is justified because it was not evidenced interest for GMO use in the forestry sector.</p>

Comment or Mitigation Measure	---

	Indicator
2.2.1	The BP has implemented appropriate control systems and procedures to verify that feedstock is sourced from forests where there is appropriate assessment of impacts, and planning, implementation and monitoring to minimise them.
Finding	<p>Most environmental legal requirements relating to forestry planning activities are included in Portugal's forestry legislation. In the administrative process of forest planning or forestation projects, the competent entities are centrally consulted by the national forest authority (ICNF). Management Plans including Forest Intervention Zone (ZIF), Community Use Area Plan (PUB) and Intervention Special Plan (PEIF) have been in place since 2000, and (to 2013) cover about 44% of Portuguese forest area. In private areas, forest plans are mandatory for all forest areas greater than a certain area (from 25 ha. to 100ha, depending on the region); however lack of this requirement has not resulted in any known penalties. In public areas, forest plans are obligatory for all areas (state forest, municipalities, etc.); however numbers from 2012 indicate that only 43% of these forests have the PGF. As of 2015, it is an objective of the forest authority ICNF that 100% of its areas should have a PGF by 2017 (for all public areas). In communitarian forests plans are obligatory for all areas however 2015 data show that Forest Plans (PUB) are in place in only 60% of cases. Forest Management Plans should include identification of most part of potential impacts and measures to minimize them. However, it is not a specific tool used to monitor environmental impacts, on FMU Management Plans. Instead there are the Regional Forest Plan covering all country which contains the most part of recommendations and tools to address forest impacts. Regional Forest Management Plans (PROF's) include monitoring specifications related to sustainability of forest resources, detailing all biotic and abiotic factors but also soils, and a list of potential impacts. Best practices are included for each forest management program. First generation PROF's were approved ten years ago, and they are all in a revision, being expected to be approved soon. No clear cuts are allowed, sustainable and best practices are mandatory by the authorities, specially under Portuguese Natura 2000 law. The national nature conservation system is based on legal protection regimes (such as The National network of protected areas, Natura 2000 network, etc.), which limits the activities allowed in these areas. There is also an inspection authority, SEPNA, and a strong system of protection (effective protected áreas and legislation) in place. Even so Reginacork is concerned and the Manager of the Certificate or the Responsible of Reception carries out audits to suppliers (Beginning of the year or part 1 of the process) by documenting them in the 'CW Vendor Audit' report cdr04. The procedures are in document 'Reginacork DDS and FSC manual' (please see attached). The supplier</p>

	<p>agrees to alert Reginacork, if it changes the source of the supply área. As a result, this control has made it possible to have a better understanding of all the traceability of raw material and this is reflected in the fact that there are no problems with suppliers, raw materials or land disputes. Larger scale activities are obliged to address a legal impact assessment and monitoring processes so an Evaluation of the risks and possible impacts of harvesting operations (EoR) must be done to conversions above 50 ha. or reforestations with fast growth species above 350 ha. These figures are lower when they occur inside Sensitive Areas (Protected, Classified and Monumental Areas), where it is obligatory to have this approved EoR if conversion to non-forest uses involves an area greater than 10 ha or forestation/ reforestation is taking place with fast-growing forest species covering over 70 ha. In case no forest plan is available (no PROF, PGF ZIF, PUB, SNAC, as well as no PEFC or FSC certification) an additional assessment of environmental impacts is made and recorded before harvest. Reginacork always makes an Evaluation of the risks and possible impacts of harvesting operations (EoR) and checks the field study of the suppliers. Therefor it is concluded that the impact assessment is covered by various tools and it is considered as specified risk.</p>

<p>Risk Rating</p>	<p>Specified Risk</p>
<p>Comment or Mitigation Measure</p>	<p>There is a specified risk on this point, mainly in case no forest plan is available (no PROF, PGF ZIF, PUB, SNAC, as well as no PEFC or FSC certification). Special attention deserve areas with dimensions below the minimum threshold for mandatory Forest Management Plan (refer to PROF) and outside SNAC, as also areas where PGF is mandatory or within SNAC. Reginacork makes an 'Evaluation of the risks and possible impacts of harvesting operations' (EoR) on sites related to the SBE program. The EoR and the field study of the supplier evaluate: • The possible economical, ecological and social impact of the forest operations including its surroundings. Harvesting operations can be changed to avoid negative impacts. • The quality of the management (by the land owner) prior to harvesting and regeneration plan. Indicators 2.2.2, 2.2.3, 2.2.4, 2.2.6, and 2.4.2 include relevant management measures which are checked. Reginacork monitors</p>

	<p>the plots to be harvested intensively and checks the field studies of its feedstock suppliers and the performed Risk Mitigation Measures. Reginacork does not classify all feedstock coming from the 'SBE approved suppliers' as 'SBP-compliant feedstock'. For example, if an estate has been poorly managed by a forest owner in the past, or does not comply with the SBE requirements on forest regeneration, Reginacork does not categorise feedstock to 'SBP-compliant feedstock'.</p>
--	---

	Indicator
2.2.2	<p>The BP has implemented appropriate control systems and procedures for verifying that feedstock is sourced from forests where management maintains or improves soil quality (CPET S5b)</p>
Finding	<p>Soil quality in Portugal has not a positive evolution since historic times as the major part of Mediterranean region. Following FAO. 2013. State of Mediterranean Forests. Rome. http://www.fao.org/docrep/017/i3226e/i3226e.pdf '(...) 45 percent of European soil is degraded and depleted of organic matter and noted that the problem was particularly pressing in the Mediterranean region. Degradation can involve erosion, settling, the loss of organic matter, salinization, landslides, the loss of soil biodiversity, acidification, desertification and subsidence. All these problems could be exacerbated by climate change. (...) Figure 1.24 shows that there were considerable differences between countries, with losses of arable land greater than 25 percent in Croatia, Malta, Portugal and The former Yugoslav Republic of Macedonia. From 1992 to 2009. At national level, following Desertification Convention 5.1 Desertification Susceptibility (https://dre.pt/application/file/65985917): for Portugal, it can be concluded that, in the last half a century, the area of susceptibility to desertification clearly expanded in the mainland territory particularly in the period 1970-2000, and then for the 1980-2010 series, and is even more relevant as expansion for the 2000-2010 series, which corresponds to the most recent period analysed, with annual droughts particularly severe. It is known, therefore, that aridity, then susceptibility to desertification, affected, in the last three decades (1980-2010), 58% of the territory of the Continent, when in the series of 1960-1990 this affectation was of 36%, being included in this context mainly the areas of the South and the Interior Center and North. In the climatic series of the last decade, about 63% of the mainland territory is classified as areas susceptible to desertification. FAO- Land Degradation Index — LDI, developed for mainland Portugal (2000-2010) states that the national territory has 32.6% degraded lands and 60.3% are included in the fair to good condition. Lands and soils that accumulate biomass over time are about 67,8% but static trends were observed in 30,8% of territory and 1,5% have a regression on land quality. Later on, Forest Services used aridity index to produce the susceptible map of desertification, indicating priority areas for EU forest grants for forestation projects. The results of this FAO study, among others, were used to create National Program Against Desertification, which is adopted, among others by Regional Forest Plans, defining forest procedures for spaces for carbon sink and other for energetic use of biomass. The private and public Forest Management Plans should adopt these designations and procedures on their implemented management practices and procedures. Specifically on forest soils it is recognized the problem of nutrient and carbon exportation due to harvesting and residues removal in a significant part of the country which is affected by erosion and desertification problems Although there is a broad consensus over soils fragility in much of the country, policies that contribute decisively to the conservation and improvement of soil quality in Portugal have not been implemented on the</p>

	<p>last decades. These implemented forest policies have not prevented the installation and exploitation of commercial timber forest stands including plantations of intensive softwood and hardwood plantations in sensitive soils with erosion risks contributing to expand the susceptible areas to desertification. The legal and regulatory framework includes restrictions and safeguards for soil use and mobilization operations with particular emphasis on sensitive, steep and near-water areas (called the National Ecological Reserve). However, as shown by above cited studies and data, reality at ground level does not reflect the application of these restrictions. Also forest residues removal from the field is regulated in Portugal, so loggers and owners have some legal obligations, related with both fire and phytosanitary policies. These obligations are depending on species, areas, seasons and regions. Process of forest residue treatment is commonly included on Best Practices but also on wood supply contracts, and forest land leasing. According to the available information, it is considered that on small size forest properties risk is low, as small scale also reduces the threats and risks involved with soil operations. The Portuguese forest sector often has bad practices regarding soil preparation, leading to a higher risk of erosion and also to a lower soil productivity. There is also a situation regarding soil protection that it is not settled in Portuguese legislation, since it is not mandatory to do environmental impact assessments before each operation, especially for small forest owners, so many times mitigation measures are not defined resulting in soil impacts. Therefore, and using a precautionary approach, it is considered specified the risks for soil quality of sourcing biomass feedstock on forest lands located on desertification susceptible area according to Forest Services (ICNF) cartography and with size above minimum size required for Forest Management Plan, is considered a specified risk.</p>

Comment or Mitigation Measure	<p>Before harvesting operations commence the plot is evaluated on this point and records are kept. Best forestry practises are applied. Maps can be obtained from 'Reserva Ecológica Nacional' (REN). Reginacork demands an field study from all feedstock suppliers. The Reginacork's EoR and the field study of the supplier address the specified risk on soil degradation: best practices have to be applied ('Best practices regarding harvesting operations').</p> <ul style="list-style-type: none"> • Low intensity of forestry, selective cuttings and small clear cuts of maximally 5 ha. were needed considering the soil and groundwater level. • Regeneration focusses on tree species that maintain or improve soil quality • Leave nutrients in the forests, mainly the green fraction of forest residues (on the other hand other forest residues need to be cleared to prevent forest fires. • Do not operate near-water areas (called the National Ecological Reserve) For example, on dry locations (elevated grounds or on slopes) selective cuttings are required, because the ground gets less direct impact of the sun and the forest and (natural) regeneration can maintain soil quality. On other locations (small) clear cuts can sometimes have the advantage that several kinds of broadleaved trees regenerate naturally, what improves soil quality. After clear cuts, the groundwater level can rise, what sometimes is an advantage. In order to improve soil protection from forest activities, the bReginacork checks if there is a RJAAR for each new plantation. Reginacork checks the field study of its suppliers. Poor soil quality can lead to erosion and other problems. Therefore, this indicator is related to indicator 2.2.6.

	Indicator
2.2.3	The BP has implemented appropriate control systems and procedures to ensure that key ecosystems and habitats are conserved or set aside in their natural state (CPET S8b).
Finding	Our pellets are FSC and SBP certified. Our Plant Manager studies the environmental aspects of the forest harvest and ensures endangered species are not used and protected. Portuguese authorities have listings as well on-the-ground agents to ensure compliance with legislation, specially protected areas (natura 2000 law) and FSC/PEFC areas. Portugal has identified the Nature 2000 areas (protected areas) and PROF regions and they have a FSC Controlled Wood low risk assessment. There are no CITES tree species in our supply base. In Portugal, key ecosystems and habitats occur mostly in Protected areas and in Classified Areas (Natura 2000). The overlap of classified areas over protected areas is approximately 1/3 of the total, which means that approximately 2/3 of classified areas are not included on protected areas of the National Network of Protected Areas. Also there are key ecosystems and habitats occurring outside Protected and Classified areas.
Means of Verification	Reginacork's Evaluation of the risks and possible impacts of harvesting operations (EoR) Field assessment suppliers Supply contracts DDS Reginacork FSC manual
Evidence	See evidences reviewed listed at indicators 2.1.1 and 2.1.2, above.

Reviewed	
Risk Rating	Specified Risk
Comment or Mitigation Measure	<p>Reginacork prepares (publicly available) data on Ecosystems and habitats (see above 2.1.1 on mapping and 2.1.2 on identifying and addressing potential threats). This information is given to all feedstock suppliers. Feedstock suppliers are trained to recognise key ecosystems and habitats. Most importantly, the feedstock suppliers inspect visually the harvesting plot and report on the results. Key ecosystems and habitats are indicated on the harvesting maps. Best practises are used to protect the high ecological values. The harvesting operations conserve these objects, mainly by not cutting the woodland or forest directly around them. In exceptional cases, low intensity harvesting operations are possible without damaging these objects.</p> <ul style="list-style-type: none"> • Study key ecosystems on the harvesting plot, conserve areas of ecological value • Study flora and fauna at the harvesting plot, nests, breeding areas, antshills conserve protected tree species and habitats • Do not operate near-water areas (called the National Ecological Reserve) Reginacork demands its field study from all feedstock suppliers. Reginacork monitors the harvesting operations of its feedstock suppliers and checks the Field study of its suppliers.

	Indicator
2.2.4	The BP has implemented appropriate control systems and procedures to ensure that biodiversity is protected (CPET S5b).
Finding	<p>Biodiversity is included on fundamental environmental law on its article 10th (Law 19/2014 14/04) and is fully covered by biodiversity and nature conservation legal framework. In Continental Portugal the protected areas and Natura 2000 sites covers 2.017.803 ha meaning 20.47% of the territory. As on Convention on Biological Diversity: 'Portugal's National Biodiversity Strategic Action Plan NBSAP was based on the following ten guiding principles: an overall higher level of protection; the sustainable use of biological resources; prevention; precaution; recuperation; responsibility; integration; participation; international cooperation and decentralization. The NBSAP then lists 10 fundamental strategies that form the basis of their action plan, which include: to promote scientific research and knowledge of local patrimony; to enhance the National Protected Areas Network; to promote the valorisation of the protected areas, and ensure the conservation of all social, cultural and natural components; ensure conservation and valorisation of areas within the Natura 2000 Network; implement, across the entire national territory, actions specific to the conservation and management of species and habitats of particular interest; integrate conservation and sustainable use principles into national and regional policies and laws; reinforce cooperation between all levels of administration; promote education and formation in conservation fields; ensure public education, awareness and sensitization; and strengthen international cooperation.' (...)</p> <p>About 3,600 species of plants occur in Portugal. There are 69 taxa of terrestrial mammals, a total of 313 bird species, of which around 35% are threatened in some ways, and 17 amphibian and 34 reptile species that occur in Portugal. Some of the main threats to the biological diversity of Portugal include: alteration or destruction of habitats; pollution; overexploitation; invasive alien species; urbanization and fires. It is considered</p>

	that a significant part of biodiversity is covered and detailed by indicators 2.1.1 and 2.1.2, for which low risk was not reached in this risk assessment. All classified habitats, besides priority ones included on HCV, must be included in this indicator.
Means of Verification	Reginacork's Evaluation of the risks and possible impacts of harvesting operations (EoR) Field study supplier. Evidences of described in the 2.1.1, 2.1.2 and 2.2.3.
Evidence Reviewed	Fundamental Environmental Law n.º 19/2014 of 14/04 : http://www.icnf.pt/portal/icnf/legisl/legislacao/2014/lei-n-o-19-2014-de-14-de-abril-d-r-n-o-73-serie-i Dec -Law.nº 142/2008, of 24/07 https://dre.pt/application/file/70698029 Convention on biological diversity: https://www.cbd.int/countries/profile/default.shtml?country=pt#nbsap (see also evidence reviewed at indicators 2.1.1 and 2.1.2).
Risk Rating	Specified Risk
Comment or Mitigation Measure	1) Reginacork prepares (publicly available) data on biodiversity researches and programs, red lists of Portugal, CITES, etc (see above 2.1.1 on mapping and 2.1.2 on identifying and addressing potential threats, HCV 1 – Species diversity). This information is given to all feedstock suppliers. 2) Feedstock suppliers are trained to recognise the protected biodiversity and how to conserve them. These species are often related (it can be indicator species) to key ecosystems which need conserved (previous indicator). 3) The harvesting teams inspect visually the plot, make photos and report on the results. Endangered flora and fauna are indicated on the harvesting maps. Reginacork demands its field study from all feedstock suppliers. 4) Procedure 'Best practices regarding harvesting operations'. Best practices include measures to conserve and increase biodiversity (for example, standing dead wood, prescribed burning and other disturbances improving the conditions for endangered species flora and fauna). 5) Reginacork monitors the harvesting operations of its feedstock suppliers and checks the Field study of its suppliers.

	Indicator
2.2.5	The BP has implemented appropriate control systems and procedures for verifying that the process of residue removal minimises harm to ecosystems.
Finding	For soil matters related with residue removal see indicator 2.2.2. In Portugal forest residues removal from forests is regulated so loggers and owners have some legal obligations, related with both fire and phytosanitary policies. The manifest document informs that the executing company is responsible for residues removal. In addition, this document refers to the destination / location where the wood will be treated Based on the available information this indicator is considered low risk.
Means of Verification	Manifest. Records of Reginacork field inspections.

Comment or Mitigation Measure	---

	Indicator
2.2.6	The BP has implemented appropriate control systems and procedures to verify that negative impacts on ground water, surface water and water downstream from forest management are minimised (CPET S5b).
Finding	<p>Reginacork considers the landscape where the harvest operations are executed, including hill slopes and streams that can overflow and demands the same from its feedstock suppliers. Clear cutting (of several ha.) is avoided in areas where all conditions are at high risk for soil erosion. In these cases, is followed the ICNF Handbook for forest best practices: 'In the areas surrounding the water lines the risk of erosion is often very high, since these are areas of concentration of rainwater runoff. In these bands (with a minimum width of 10 meters for each side, as stated in the legal definitions and conditions of legal limits (Decree-Law no. 468/71, of 5 November) a strict prevention of erosion phenomena shall be performed, and it is therefore essential to adopt measures to protect it, such as maintaining all or a significant part of the natural vegetation and not inflict harm to the soil.' These best practises are required to comply with the requirements of SBE program. Water legal framework includes water law and national and hydrographical basin plans, being Portuguese Environment Agency the national authority. Other authorities like SEPNA (National Republican Guard) and Nature Guards and Vigilantes, also have competencies of water resources inspection actions. Reginacork has never been penalized by any of these entities because it never operates on water lines. National Ecological Reservation is a territory classification of sensitive areas for 'ecosystem services' where water issues are addressed, and some restrictions are in place to prevent negative impacts in slopes, valleys and other sensible situations. Every forest projects and plans must comply with this regulation, and they should be in place, for example in projected soil preparation techniques. The risk is applied to all private, communitarian, and public forest areas which are not managed by ICNF. ICNF Handbook for forest best practices defines: 'In the areas surrounding the water lines the risk of erosion is often very high, since these are areas of concentration of rainwater runoff. In these bands (with a minimum width of 10 meters for each side, as stated in the legal definitions and conditions of legal limits (Decree-Law no. 468/71, of 5 November) a strict prevention of erosion phenomena shall be performed, and it is therefore essential to adopt measures to protect it, such as maintaining all or a significant part of the spontaneous vegetation and not perform any mobilization of the soil.' Usually prevented by legal and regulatory framework, however in Portuguese implemented legislation there is not a clear and effective legal tool over all territory, being exceptions the Northern regions, where 10 hectares is defined as the maximum clearcuttings area as defined on Regional Forest Plans. Also some Municipalities may have municipal regulations about</p>

	<p>clearcutting fellings. So it is considered there are specified risks that feedstock is sourced from forests when clear cuttings are done over a specific size area. This specific area is defined regionally by each Regional Forest Plan (PROF), as the maximum clearcutting area or the size of even aged mono-specific forest stand. In Portugal there is the problem of illegal plantations where there is the risk in causing impacts in water resources, and also it is not mandatory by law to perform environmental impact assessments for small areas for each operation leading to a higher risk of causing impacts in water resources since mitigation measures are not defined. In order to prevent impacts on water resources resulting from forest activities, the biomass producer should control if there is a RJAAR for each new plantation, and should also demand an environmental impact assessment for every harvesting in order to prevent impacts on the water resources, resulting from these operations. This is considered a specific risk.</p>
Means of Verification	<p>Reginacork's Evaluation of the risks and possible impacts of harvesting operations (EoR) Internet research GIS maps of HCV areas Regional, publicly available data from a credible third party as FSC and PEFC reports Game management plans Regional Forest Plans Forest Operating Procedures Publicly available information on the protection of the values identified Aerial photos Assessment at an operational level of measures designed to minimise impacts on the values identified Erosion and desertification programs and maps FSC Manual DDS Reginacork Field Study Suppliers</p>

Risk Rating	Specified Risk
Comment or Mitigation Measure	<p>1) Reginacork studies data (from publicly available information, researches and programs) for its harvesting teams on ground water, surface water and streams (see above 2.1.1 on mapping and 2.1.2 on identifying and addressing potential threats, HCV 1 – Species diversity). This information is given to all feedstock suppliers. 2) Feedstock suppliers are trained to not contaminate ground water and to plan forest management operations that protect the soil, forest and surroundings from surface water. 3) The harvesting teams inspect visually the plot and the hill slopes and streams in the surroundings and report on the results. Reginacork demands its field study from all feedstock suppliers. 4) Procedure 'Best practices regarding harvesting operations'. Best practices include forest management measures that protect the plot against too high or low ground water levels, and erosion (surface water moving too quick or too slow). Related to a too quick runoff of surface water, streams in the surroundings are considered. The landscape where the harvest operations are executed is considered, including hill slopes and streams that can overflow. In areas vulnerable to water damage, the maximal contiguous clear cut area is 5 ha. 5) Reginacork monitors the harvesting operations of its feedstock suppliers and checks the submitted field studies. These best practices are required to comply with the SBE program requirements. The best practices as stated follow the 'ICNF Handbook for forest best practices': 'In areas surrounding the water lines the risk of erosion is often very high, since these are areas of concentration of rainwater runoff. In these bands (with a minimum width of 10 meters for each side, as stated in the legal definitions and conditions of legal limits (Decree-Law no. 468/71, of 5 November) a strict prevention of erosion phenomena shall be performed,</p>

	and it is therefore essential to adopt measures to protect it, such as maintaining all or a significant part of the natural vegetation and not inflict harm to the soil.'

	Indicator
2.2.7	The BP has implemented appropriate control systems and procedures for verifying that air quality is not adversely affected by forest management activities.
Finding	Air legal framework includes air law and national air quality plan, being Portuguese Environment Agency the national authority. Other police authorities like SEPNA (National Republican Guard) and Nature Guards and Vigilantes, also have competencies of air pollution inspection actions. Generally, forests are considered the best use of soil compared with other land use possibilities and forest management activities are not known in the country as to cause air pollution. Major negative impacts from forests are due to forest fires which are not considered management activities. Burning forest residues at the forest site as the traditional way is prevented with forest feedstock sourcing for biomass legal framework in force at high fire hazard periods. Forest equipment must comply with EU directives about air pollution. The forestry equipment is checked by our Plant Manager. There is a checklist of a number of parameters, from operating conditions, safety, cleaning and leaks. Based on available information the requirements included in this indicator are considered low risk.
Means of Verification	Procedure 'Best practices regarding harvesting operations'. Supply contracts Check lists on feedstock suppliers and harvesting operations Assessment at an operational level of measures designed to minimise impacts on the values identified Publicly available information on the protection of air quality as APA website. Regional, publicly available data from a credible third party. The existence of a strong legal framework in the region.

	Indicator
2.2.8	The BP has implemented appropriate control systems and procedures for verifying that there is controlled and appropriate use of chemicals, and that Integrated pest

	management (IPM) is implemented wherever possible in forest management activities (CPET S5c).
Finding	The legal framework for agrochemicals use is the Law nº 26/2013 from April 11th which applies to Portuguese context the EU Directive n.º2009/128/CE, of 21/10. Fertilisers are prescribed on some forest management systems like installation period or forest plantations, but the intensity of this use is very low according to every perspective. The implementation of this law had a very positive impact on use of agrochemicals, and included the needing of accredited training, and records (quantities, disposals, etc) to all the involved people. The use of chemicals on Portuguese forests is not common and it is very restricted to a few cases because, among others, there are few homologate products applying to the most important phytosanitary forest plagues and diseases. In this exceptional cases are pine processionary (<i>Thaumetopoea pityocampa</i>) and the eucalyptus snout beetle (<i>Gonipterus platensis</i>), but in both cases there are also other biologic and genetic measures. Based on available information the requirements included in this indicator are considered low risk.
Means of Verification	Existing legislation. Level of enforcement. Assessment at an operational level of measures designed to minimize impacts on the values identified. Monitoring record.
Evidence Reviewed	Law n.º 26/2013 de 11 /04: https://dre.pt/application/file/260367 Pine processionary official Plan: http://www.icnf.pt/portal/florestas/prag-doe/resource/doc/proc/proc-florest-2015.pdf Eucalyptus snout beetle official plan: http://www.icnf.pt/portal/florestas/prag-doe/ag-bn/gorg-eucal
Risk Rating	Low Risk
Comment or Mitigation Measure	---

	Indicator
2.2.9	The BP has implemented appropriate control systems and procedures for verifying that methods of waste disposal minimise negative impacts on forest ecosystems (CPET S5d).
Finding	The legal framework for waste disposal is based on a recent law which applies to Portuguese context the EU Directive n.º 2008/98/CE. Portuguese Environment Agency is the national authority but other police authorities like SEPNA (National Republican Guard) and Nature Guards and Vigilantes, also have competencies of waste disposal. Also municipal authorities can apply municipal rules to implement applicable legislation. Waste disposal on forest lands exist in Portugal and it affects both private and public lands. But as it is illegal in the country there are efforts made by private ours suppliers and authorities to collect the waste and send it to final legal destination. Some of the measures used by owners include fencing of their lands, sign installation against waste disposal and formalizing complaints to authorities in case of illegal waste disposal. Based on available information the requirements included in this indicator are considered low risk.

Means of Verification	Existing legislation; Level of enforcement; Regional Best Management Practices.
Evidence Reviewed	Waste Management and Planning Official page: https://www.apambiente.pt/index.php?ref=16&subref=84 Decree-Law n.º 73/2011 de 17/06: https://www.apambiente.pt/_zdata/Politicar/Residuos/DL_73_2011_DQR.pdf Waste National Management Plan: file:///C:/Users/imobi_000/Downloads/Projeto_PNGR_2011-2020.pdf European Waste Statistical: http://ec.europa.eu/eurostat/statistics-explained/index.php/Waste_statistics/pt
Risk Rating	Low Risk
Comment or Mitigation Measure	Waste gathering and disposal is checked during the assessment of harvesting operations.

	Indicator
2.3.1	Analysis shows that feedstock harvesting does not exceed the long-term production capacity of the forest, avoids significant negative impacts on forest productivity and ensures long-term economic viability. Harvest levels are justified by inventory and growth data.
Finding	At the stand level there are some forest producers that harvest Eucalyptus stands before the appropriate harvesting time not following the best practices and the silvicultural models defined by the PROF for each region. This is a situation that happens due to several reasons, first because forest producers want revenue from the stands as fast as possible, and also because most of the time they do not have the appropriate knowledge to understand that the stand have not reached to the optimal production level. In fact there is a small window where a forest producer is allowed to harvest the Eucalyptus by law, but the stand has not reached its optimal production according to the correct silvicultural model yet. In order to prevent those situations to happen, biomass producers should ensure that forest producers follow the appropriate silvicultural models for Eucalyptus stands. Statistical information on National Forest Inventory is fully available from IFN5 (2005) and preliminary results from IFN6 (2010). Preliminary results from IFN6 (2010) for main species in pellet production show that: Total forest area in Mainland Portugal is 3,154,800 has of which 2,972,356 has correspond to forested area. • Eucalyptus plantations are larger Portuguese forests. Forest cover with Eucalyptus has increase 13% from 1995 to 2010 (over 90,000 has in the period to a total surface of 812,000 has in 2010; 755,355 has on forested areas) mostly on areas converted from Pinus pinaster (70,000 has in the period). Pinus Wilt Disease/Nemátodo-do-pinheiro pest, fires and economic motivations can be behind it. • Pinus pinaster forests have decrease significantly from 1995 to 2010: 27% on total surface (263,000 has in the period to a total surface of 713,000 has in 2010; 624,248 has on forested areas). 163,000 has was converted to open land, mostly related to Pinus Wilt Disease/Nemátodo-do-pinheiro pest and fires and 70,000 has to Eucalyptus plantations, which can also include economic motivations. Represents the majority of inputs in BP feedstock. Analysing statistical information available for average annual growth (AMA) from IFN5 (2005) show for Mainland Portugal: - On Eucalyptus an average annual growth of 4,375,000 m3/year based on 2005 inventory data. Currently the value will be significantly higher. Eucalyptus wood from Portugal consumption in 2014 was 5,400,000 m3 (CELPA data). Eucalyptus is fast growing specie, over 12 years, with one and only cut on the period: final clear cut. So

	<p>harvesting does not compromise long-term production of the forest. - On Pinus pinaster an average annual growth of 3,650,000 m³/year based on 2005 inventory data. Currently the value will be lower. Pinus pinaster wood from Portugal harvested in 2014 was 2,247,000 m³ (Centro Pinus data). So Pinus pinaster wood available from Portugal is under AMA. - On the analysis it is relevant also to take into account that: 1. Pinus Wilt Disease/Nemátodo-da-madeira-do-pinheiro pest have affected significantly to Pinus pinaster. 2. Fires continue to be a relevant problem in Portugal. 3. Data from CentroPinus states that pine wood consumption of timber industry in 2014 was 4,360,000 m³, with a relevant data a 1,400,000 m³ for pellets, 32% of total. Also 32% of pine wood used by CentroPinus partners was imported in 2014. Percentage of imported pine wood used in 2006 was 3%. So lack of pine wood from Portugal is being covered with importations, mainly from Spain. 4. Data from CELPA states that Eucalyptus consumption of pulp and paper industry in 2014 was 7,800,000 m³ (4,980,000 m³ in 2005), of which 2,415,000 m³ were imported, mainly from Spain. So all above information shows that actual harvesting volume does not exceed sustainable values and compromises long-term economic viability of stands. Thus the risk for this indicator has been assessed as Low. Although harvest levels are not justified by inventory and growth data in many cases at a forest level.</p>
Means of Verification	<p>Volume and growth data and yield calculations, and Operational Practice indicate that biomass feedstock harvesting rates avoid significant negative impacts on forest productivity and long-term economic viability.</p>

Risk Rating	<p>Low Risk</p>
Comment or Mitigation Measure	<p>Reginacork takes into account the chance that a land owner wants to sell its wood (on stem) too early according to the law and best forest practices.</p>

	Indicator
2.3.2	Adequate training is provided for all personnel, including employees and contractors (CPET S6d).
Finding	A center for forestry professional training under the direct management of the ICNF and has as main objective the training and professional enhancement, with special emphasis with regard to forestry operations. He has a decision power in forestry operations, use of machines, methods and techniques used, always giving due and necessary attention to compliance with safety, hygiene and health at work. All our suppliers provide training and qualifications for the management of forestry machines. NOTE: Portugal is a country with an old tradition on forests activities. University education is provided on the technical side with several colleges in the country. There are specific courses for field machinery operators but it is planned to be updated on the National Catalog of Formations a new training on Forestry Machinery Technician not yet available. Under this information the indicator is assessed as specified risk.
Means of Verification	Records of Reginacork field and company inspections Qualifications of employees at Reginacork Suppliers Training course Existing legislation Level of enforcement Reginacork's monitoring procedure includes checklists on feedstock suppliers and harvesting operations.
Evidence Reviewed	Estrategia Nacional das Florestas (RCM n.º 6-B/2015 - Diário da República n.º 24/2015, 1º Suplemento, Série I de 2015-02-04); ICNF portal (http://www.icnf.pt/portal/icnf/docref/enf) (http://www.icnf.pt/portal/florestas/gf/cotf); (http://www.icnf.pt/portal/florestas/gf/cotf/o-q-e); (http://www.icnf.pt/portal/florestas/gf/cotf/formacao).
Risk Rating	Specified Risk
Comment or Mitigation Measure	Reginacork trains its personnel on all relevant aspects and demands the same from its feedstock suppliers. This is not always covered sufficiently by legislation. During the feedstock supplier's inspections of Reginacork, are checked: the training records, (new) workforce, and the hiring of specialists. The level of knowledge of personnel is inspected during site visits. Reginacork's monitoring procedure includes checklists on feedstock suppliers and harvesting operations.

	Indicator
2.3.3	Analysis shows that feedstock harvesting and biomass production positively contribute to the local economy, including employment.
Finding	At the regional and local level, Reginacork contributes to the increase in employment. The Reginacork contributes a lot to local employment for qualified professionals. Data from INE 2012 states that 91% of Portuguese forest sector enterprises have from 1 to 10 workers. Forest industries employ 78,000 people (12% of all Portuguese processing industry, 1.7% of Portuguese employed population) of which 10,600 work on logging companies and 20,800 on wood industry. Also annual turnover of forest sector industries was in 2012 over 7,392 M€ (2,497.6 M€ wood and furniture industry, 1,320.4 M€ cork industry and 3,574.6 M€ pulp and

	paper industry), representing 10% of all Portuguese processing industry. Despite the recent crisis, the forest sector has maintained its contribution, in macroeconomic terms, in terms of added value. Biomass/Feedstock with origin in Portuguese forest is supplied through domestic supply chains to BP's so economic impact related to feedstock chain from the forest, transportation, processing and BP is local. Also it is mainly complementary with other wood industries as use on their processes low quality wood (which previously it was not exploited or it was burned) or wastes from industrial processes. With all of these considerations we can conclude that biomass production contributes positively forest sector and to local economy and thus the indicator has been assessed as low.
Means of Verification	Data on Reginacork and the regional economy.

Comment or Mitigation Measure	---

	Indicator
2.4.1	The BP has implemented appropriate control systems and procedures for verifying that the health, vitality and other services provided by forest ecosystems are maintained or improved (CPET S7a).
Finding	In Portugal the 'health, vitality and other services provided by forest ecosystems' can be of importance to the local population. Forests can be of importance to the environment around the forests, they can reduce the impact of extreme weather, and reduce the impact of air-pollution, and noise. Poor forest management can be a direct treat to the local population (see next indicator) or create a conflict of interests. For example, it takes only one dense forest stand to improve the perception of an area, if a certain industrial object needs to be covered up (visual pollution). Forest (ecosystems) can be essential for: • Breaking hard winds and rainfall (roads and houses); • Recreation in and around the forests; • Hunting, fishing and gathering of berries and mushrooms; • Agriculture near the forests (this is of

	<p>importance in Portugal). In Portugal nearly all forests are relatively small private ownership plots. One can rarely speak about any coordinated control system of the land owner as required here “appropriate control systems and procedures for verifying that the health, vitality and other services provided by forest ecosystems”. The interests of the local population in the services forest ecosystems provide are practically never taken into account by the private forest owners. Reginacork is of the opinion that general data and certain statistical averages in certain areas do not make a biomass supplier comply with this requirement. To solve this point, the opinion of local residents and organisations about the quality of the forest management of the land owner, and the present harvesting and regeneration plans need to be taken into account. Small adjustments to a forestry plan can make a large difference to them. For example, not cutting an old tree with exceptional esthetic / recreational value. Although there is a specified risk for insufficient assessment of the impact of harvesting operations that replace (destroy) the existing forest ecosystem, nearly all risks are addressed by other indicators (with specified risk), such as indicators 2.2.1, 2.2.2, 2.2.3, 2.2.4, 2.2.6, 2.4.2, and 2.6.1. In addition to measures taken to comply with the specified risks of other indicators, to comply with indicator 2.4.1 the possible impacts of the harvest operations on the forest and its surroundings are assessed (before the harvesting operations commence), not only in relation to the environment, but also in relation to the interests of the local population, farmers, and people interested in recreation.</p>
Means of Verification	<p>Reginacork’s Evaluation of the risks and possible impacts of harvesting operations (EoR) Manifest. Field Study Suppliers. Overall evaluation of potential impacts of operations on forest ecosystem health and vitality Assessment of potential impacts at operational level and of measures to minimise impacts. Regional Best Management Practices. Supply contracts. Interviews with local people.</p>

Risk Rating	Specified Risk
Comment or Mitigation Measure	<p>1) Feedstock suppliers are trained to recognise health, vitality and other services provided by forest ecosystems. 2) The harvesting teams inspect visually the plot and the surroundings and report on the results (make photos). Reginacork demands its field study from all feedstock suppliers, which addresses these environmental services. Best practises are used. Many of the relevant risks are addressed by other indicators (with specified risk), such as indicators 2.2.1, 2.2.2, 2.2.3, 2.2.4, 2.2.6, and 2.4.2. 3) The possible impacts of the harvest operations on the forest and its surroundings are assessed (before the harvesting</p>

	<p>operations commence), not only in relation to the environment, but also in relation to the interests of the local population, farmers, and people interested in recreation. Reginacork underlines that these services can be of importance to the local population. Forests can be of importance to the environment around the forests, they can reduce the impact of extreme weather, and reduce the impact of air and 'visual' pollution, as well as noise. Forest services that need to be considered: a. Breaking hard winds and rainfall (regarding roads and houses); b. Recreation in and around the forests; c. Hunting, fishing and gathering of berries and mushrooms; d. Agriculture near the forests (this is of importance in Portugal). 4) Reginacork monitors the harvesting operations of its feedstock suppliers and checks the submitted Field Studies. It checks with stakeholders if there are any complaints (see also below 2.6.1).</p>
--	--

	Indicator
2.4.2	The BP has implemented appropriate control systems and procedures for verifying that natural processes, such as fires, pests and diseases are managed appropriately (CPET S7b).
Finding	<p>Pests, diseases and fires are today the greatest perceived risks in the Portuguese forest sector. As stated in previous indicator biotic and abiotic risks are supported by disturbances affect in 2011 24% of the forest area, generated by a regressive vicious cycle that combines fire, 'seca', pests, diseases and invasive species. The national program for forest fire protection (PNDFCI) establishes various levels (national, regional, municipal and local) in order to create a network of forest fire prevention (primary and secondary on public level and tertiary on forest owner level). This system aims to compartmentalize extensive woodlands and contribute to the containment and firefighting. The identification of these elements is defined in the various plans in force particularly in the Forestry Management Regional Plans (PROF) and Forest Defense Municipal Plans Against Fires (PMDFCI), which also define the responsibilities for its implementation on field. In terms of forest owners are defined in Forest Management Plans and related (PEIF, PUB). Private forest lands can be grouped into Forest Intervention Areas (ZIFs), forest policy instrument to ensure efficient management of forests at the landscape scale and the consistent application of public support for forestry development. ZIFs are continuous land area, with a majority of forest areas, subject to a Forest Management Plan and a Defense Plan for Forest and managed by a single entity. Until July 2016 they are constituted 179 ZIF, covering 924,447 hectares of territory. One of the objectives of ZIFs is to reduce the conditions of ignition and fire spread implementing on the field planned measures. Field implementation of planned measures is uneven in Portugal. Also fires are the greatest perceived risks in the Portuguese forest sector as it recognized by public administration. On the above information specified risk is assessed on the fire management at forest level There are enforcement and monitoring on the performance of our part: harvest, transporters and warehouses. Every step need of official document.</p>
Means of Verification	Reginacork's Evaluation of the risks and possible impacts of harvesting operations (EoR). Field Study Supplier. Regional Best Management Practices. Supply contracts. Assessment of potential impacts at operational level and of measures to minimise

	impacts. Regional, publicly available data from a credible third party. The existence of a strong legal framework in the region.

Risk Rating	Specified Risk
Comment or Mitigation Measure	<p>1) Reginacork studies data (from publicly available information, researches and programs) for harvesting teams on risks and regulations regarding fires, pests and diseases. This information is given to all feedstock suppliers. 2) Feedstock suppliers are trained to recognise poor forest management and on mitigation measures. 3) The harvesting teams inspect visually the plot and make photos. Reginacork demands its field study from all feedstock suppliers, in which this point is addressed. Feedstock suppliers inspect if the plot was managed well on these points, if not, the feedstock is not considered compliant to the SBE program (will not become SBP-compliant feedstock). 4) Best practises are used by the harvesting teams regarding management of fires, pests and diseases. These include: a. Traps for NMP (Pine Wood Nematode (<i>Bursaphelenchus xylophilus</i>, and its vector the insect <i>Monochamus galloprovincialis</i>) b. Use of net (cover) during transport of wood in the period insect vector NMP c. Phytopharmaceutical application on the ground d. Crushing of the same wood with no lead time of 2, 3 days. wood with symptoms. e. Ensure that all suppliers have an economic operator registration. f. Reginacork only accept the raw material with the manifest. g. Cleaning of all utensils and machinery used in the handling of woody material. h. Application of good forest practices to avoid a spread of this pest. 5) Reginacork monitors the harvesting operations of its feedstock suppliers and checks the submitted field studies. Sufficient management by the forest owner, and best practises by the harvesting teams are required to comply with the SBE program requirements.</p>

	Indicator
2.4.3	The BP has implemented appropriate control systems and procedures for verifying that there is adequate protection of the forest from unauthorised activities, such as illegal logging, mining and encroachment (CPET S7c).
Finding	Unauthorized activities such as illegal logging, mining and encroachment are not a significant problem in Portugal. There are low scale problems as illegal littering, loose dogs, unauthorized sports, theft of firewood, wood or fruits, poaching. Illegal or unauthorised activities in Portuguese forests generally have limited economic or biological impact. There are also some problems related to Conversion which can be catalogued under unauthorized activities but they are described in its corresponding indicator (2.1.3). The indicator has been assessed as low.
Means of Verification	Records of Reginacork field inspections. Publicly available information (News and media).
Evidence Reviewed	ILLEGAL LOGGING PORTAL, Portugal (http://www.illegal-logging.info/regions/portugal) Transparency international, corruption perception index Portugal (https://www.transparency.org/country/#PRT)
Risk Rating	Low Risk
Comment or Mitigation Measure	---

	Indicator
2.5.1	The BP has implemented appropriate control systems and procedures for verifying that legal, customary and traditional tenure and use rights of indigenous people and local communities related to the forest, are identified, documented and respected (CPET S9).
Finding	97% of Portuguese forests are private (See also indicator 2.4.1). Approximated number of private owners in Portugal is over 500,000. 8% of private forest are under communitarian management (Baldios) based in old customary and traditional tenure and rights and regulated by specific law. As most of the country forest is under private property civil code is applied which includes the following rights: • - to use; • - to transform; • - to exclude and defend including the rights to delimitation, prohibition and defense. • - to return and compensation; • - to sale. These rights are applied to the most part of forest resources and to all of the wood resources. Customary rights consist, as stated in the indicator description, as habitual, repeated and “normal” activities. This has to do with access to water sources established for a long time as practice, passage through private property that is used traditionally by a certain community. Customary rights don’t consist on in the collection of mushrooms, plants or pine cones in a property belonging to a third party, unless this practice is perceived and seen by the community, as a traditional practice. The owner as the right over its own property. This customary right does not include licensed fenced properties for cattle or big game hunting zones. Car circulation is limited to public use roads

	and/or public domain waters and other specific situations. Over the years, legislation about private things of free use became regulated and some of them of private use. Several situations may happen, for example the pine cones were of free use until forty years ago when it became private. Another example is the game hunting which is still a public thing but private entities can pay for a hunting concession to manage it. Conflicts may exist between land owners rights based on the private things defense against the customary rights of accessing and free use recollection, as no specific legislation was updated about this issue. These conflicts may become more relevant where resources are easy to steal, like pine cones or other NTFP-Non Timber Forest Products. In the ground situations of use and abuse of fences and inadequate signs are common, including closed gates. In those situations, customary rights could maybe be disrespected. The customary right is described in the article 348th of the Portuguese civil code. The interpretation of laws is described in the article 9th of the Portuguese civil code. In the case of community areas, specific legislation regulates rights of use of common forest areas. (Lei dos Baldios).
Means of Verification	Evaluation of the risks and possible impacts of harvesting operations (EoR). Field study suppliers. Customary use rights are identified and documented. Appropriate Reginacork mechanisms exist to resolve disputes.
Evidence Reviewed	Estrategia Nacional das Florestas (RCM n.º 6-B/2015 - Diário da República n.º 24/2015, 1º Suplemento, Série I de 2015-02-04); ICNF portal (http://www.icnf.pt/portal/icnf/docref/enf) Lei nº 68-93 Baldios (http://www.proder.pt/ResourcesUser/Legisla%C3%A7%C3%A3o/Nacional/Lein%C2%BA68-93.pdf) Coelho, I.S. Risk Rating	Specified Risk
Comment or Mitigation Measure	1) Feedstock suppliers are trained to recognise possible issues with legal, customary and traditional tenure and use rights. 2) The harvesting teams inspect visually the plot, make photos and report on the results. Reginacork demands its field study from all feedstock suppliers. This aspect is addressed. If the land area to be harvested is fenced, moreover, if it has been fenced recently, the opinion of residents is assessed. Abuse of fences, blocked roads, and inadequate signs could make the feedstock non-compliant in the SBE program. 3) Reginacork monitors the harvesting operations of its feedstock suppliers and checks the assessment results of its suppliers. By addressing sustainable forest management and making an extra effort on indicators 1.2.1, 2.4.1, and 2.6.1, Reginacork integrates respecting the interests of local people into its main procedures. There are no indigenous people in Portugal nor minorities dependant on forests for their livelihood. This specified risk doesn't include the licensed cattle parks or big game hunting areas.

Indicator

2.5.2	The BP has implemented appropriate control systems and procedures for verifying that production of feedstock does not endanger food, water supply or subsistence means of communities, where the use of this specific feedstock or water is essential for the fulfillment of basic needs.
Finding	Subsistence needs for local communities are assessed as being not applicable for Portugal. There are no indigenous people in Portugal nor minorities dependant on forests for their livelihood.
Means of Verification	Appropriate mechanisms exist to resolve disputes: - Complaint procedure; - Field and office inspections (checklists); - Interviews with land owners, local residents; - Forest Best Management Practices.
Evidence Reviewed	Coelho, I.S. (2003) Propriedade da Terra e Política Florestal em Portugal (http://www.scielo.mec.pt/pdf/slu/v11n2/v11n2a05.pdf)
Risk Rating	Low Risk
Comment or Mitigation Measure	---

	Indicator
2.6.1	The BP has implemented appropriate control systems and procedures for verifying that appropriate mechanisms are in place for resolving grievances and disputes, including those relating to tenure and use rights, to forest management practices and to work conditions.
Finding	Although this risk is addressed in the general legal framework of Portugal, Reginacork is of the opinion that this indicator needs additional attention as a 'safety net', in order to perform well on other indicators, which are categorised 'specified risk'. Most harvesting companies working in the forest sector do not have complaint and comment procedures, not journals. Because of the very large number of land owners with small forested properties in Portugal, and, for example, the lack of cadastral in some regions of the country, Reginacork actively prevents grievances and disputes to arise. The aim is to track down and solve grievances and disputes before the harvesting operations commence. The procedures assess the work of Reginacork's harvesting teams and feedstock suppliers. The feedstock suppliers are also required to actively implement a complaint procedure and keep records (which are checked). Reginacork takes seriously any complaint of any person or organisation considering harvesting operations. This also

	<p>improves performance on respecting local interests (HCV 5) and cultural values (HCV 6). Grievances and disputes, including those relating to tenure and use rights, forest management practices and work conditions in Portugal are regulated by laws. Legal framework includes the Portuguese Constitution, the Labour Code and other specific regulations. The detailed procedures, duties and responsibilities of involved persons are defined in both legislation and other legal regulations. Legislation and justice system provides a route for appeal should people or companies be dissatisfied with the outcome of the dispute resolution process. Land tenure and use rights are object of Civil Code, being land tenure included on private property rights on Constitution article 62th. These rights include communitarian forests and also Forest Renting/leasing contracts. Disputes about forest management practices would involve forest authorities ICNF on both public and private forests. Specific forest management practices should be included on renting and forest services contracts as harvesting contracts. The disputes related to work conditions shall be resolved according to administrative procedures and labour legislation. Trade unions may help in disputes over work conditions. Reginacork have an internal procedure for resolving grievances and disputes ' Registo e Tratamento de Reclamações e Devoluções': Firstly our specialist need to collect this information: • Identification of the plot / area (building permit); • Identification of the owner (citizen card); • Proof of the relationship between the seller and the land in question; • Mapping; • Formalization of the business through a purchase and sale agreement between the parties; • Invoice or self-invoice if the seller can not do it. In addition to the information collected, at least one site visit is always conducted with the owner or his representative, where information is taken about: • Type of vegetation / species; • Ground boundaries / Confrontations; • Accesses. This procedure also indicates the resolution of grievances and disputes, including those relating to tenure and land use rights to forest (or land) management practices and working conditions. Whenever any of the above occurs, the technical responsible is contacted and called to the location whenever necessary. In the case of Work Accidents, Theft and Forest Fires and after ascertaining the severity of the situation are contacted the competent entities, as well as the Department of Hygiene, Security of the company. In case of Failures or maintenance, the means are put on the ground in order to solve the situation. These means can be from the company itself or from the company representative of the equipment. In case of Complaint related to court, the person in charge of the company meets at the place of court with all parties involved (seller / claimant or other). When the facts are proven and all parties are heard, the responsible person decides to adjust the business according to what happened. The closing of the complaint can be done in two ways: • If the claimant understands the purchase, the remaining portion. That is, a new buying process is opened where one makes the acquisition of what was cut by lapse together with what is standing; • The claimant does not accept to sell the remaining portion. The wood cut is evaluated and paid to the owner considering the occurrence as a payment of damages to the owner.</p>

Risk Rating	Specified Risk

Comment or Mitigation Measure	<p>1) Reginacork actively prevents grievances and disputes to arise. The aim is to track down and solve grievances and disputes before the harvesting operations commence (or not to buy from the disputed plots). 2) Reginacork makes clear to the local population that any complaint or comment related to feedstock supply is taken very seriously (via website and other communications). Reginacork takes seriously any complaint of any person or organisation considering harvesting operations. This also ensures sufficient performance on respecting local interests (HCV 5) and cultural values (HCV 6). 3) Reginacork has a complaint procedure and keep records. The feedstock suppliers are also (contractually) required to actively implement a complaint procedure and keep records. Reginacork demands its field study from all feedstock suppliers, in which the interests of local population are assessed. 4) Reginacork monitors the harvesting operations of its feedstock suppliers and checks their records on Complaints and Comments. It checks with relevant stakeholders, such as land owners, if no comments were submitted, or if the complaints were dealt with sufficiently. 5) The results of the inspections of Reginacork have direct influence on the 'SBE program approved' status of feedstock suppliers.</p>
-------------------------------	---

	Indicator
2.7.1	The BP has implemented appropriate control systems and procedures for verifying that Freedom of Association and the effective recognition of the right to collective bargaining are respected.
Finding	<p>Portugal has signed the ILO fundamental conventions, which includes the C87 Freedom of Association and Protection of the Right to Organize Convention (1948) on 1977th and C98 Right to Organize and Collective Bargaining Convention (1949) on 1964. This right is included on Portuguese constitution on article 56. Most part of working activities is covered by an annual working collective convention, which includes the forest sector. International Trade Union Confederation (IUTC) ranks 139 countries against 97 internationally recognised indicators to assess where workers' rights are best protected, in law and in practice. Portugal has a rating of 3, from 1 to 5+, in the ITUC Global Rights Index 2014. This score is given for countries where: (There are) 'Regular violation of rights. The government and/or companies are regularly interfering in collective labour rights. There are deficiencies in laws and/or certain practices which make frequent violations possible.' Authority directly involved on employment rights and conditions is Work Conditions Authority (ACT) but for many reasons other authorities are related to the issue, as Immigration and Borders Services (SEF) social security services or even tax services. All of them can make inspections to different issues related to work, with the joining of policies authorities as GNR-Republican National Guard and PSP-Public Security Police. ACT has strategic Plans for Agriculture and Forest activities and also does integrated inspections with Spanish authorities for agriculture and forestry activities. Recently one notice state that ACT bought a drone to help agriculture and forestry inspections. Inspective activities of ACT and SEF result on penalties or suspensions when illegal situations are found. It wasn't found law violations identified on the right of freedom of association and collective bargaining in Portuguese forest sector.</p>
Means of	Legislation. Level of enforcement. Portuguese constitution. Regional, publicly available data from a credible third party. Publicly available information (News and media).

2.7.2	The BP has implemented appropriate control systems and procedures for verifying that feedstock is not supplied using any form of compulsory labour.
Finding	Portugal has ratified the convention against forced labour (nº29) in 1956. Portuguese legislation is applied against any form of compulsory labour in accordance with Article 160 of the Criminal Code, one who offers, gives, servicemen, calls accepts, transports, harbours or receives a person for the purpose of exploitation, including sexual exploitation, labour exploitation, begging, slavery, harvest organs or other exploitation by criminal activities and he / she has abused the authority resulting from a hierarchical relationship of dependency (whether financial, family or work related) is punished with imprisonment of three to ten years. Source: § (Article 160 of Decree-Law No. 400/82 Penal Code amended by Law No. 59/2007

	<p>and Law No. 60/2013) International Trade Union Confederation (IUTC) ranks 139 countries against 97 internationally recognised indicators to assess where workers' rights are best protected, in law and in practice. Portugal has a rating of 3, from 1 to 5+, in the ITUC Global Rights Index 2014. This score is given for countries where: (There are) 'Regular violation of rights. The government and/or companies are regularly interfering in collective labour rights. There are deficiencies in laws and/or certain practices which make frequent violations possible.' Some cases of compulsory labour were found on agriculture activities on recent years, and same data is available about those cases on Observatory on Traffic in Human Beings Reports. Authority directly involved on employment rights and conditions is Work Conditions Authority (ACT) but for many reasons other authorities are related to the issue, as Immigration and Borders Services (SEF) social security services or even tax services. All of them can make inspections to different issues related to work, with the joining of policies authorities as GNR-Republican National Guard and PSP-Public Security Police. ACT has strategic Plans for Agriculture and Forest activities and also does integrated inspections with Spanish authorities for agriculture and forestry activities. Recently one notice state that ACT bought a drone to help agriculture and forestry inspections. Inspective activities of ACT and SEF result on penalties or suspensions when illegal situations are found. Nevertheless, in forestry there wasn't found any evidence confirming the existence of risks of compulsory and/or forced labour in Portugal. According to the available information this indicator is classified as low risk.</p>

<p>Risk Rating</p>	<p>Low Risk</p>

Comment or Mitigation Measure	Portugal has some problem with illegal working in the agricultural sector, but these problems were not detected in forest sector (yet). Reginacork does pay attention to this point during the monitoring assessment.
-------------------------------	---

	Indicator
2.7.3	The BP has implemented appropriate control systems and procedures to verify that feedstock is not supplied using child labour.
Finding	<p>In Portugal the minimum age for employment is 16 years. A minor of 16-year-old can't be used to carry out a paid activity delivered with autonomy unless he / she has completed compulsory education or is enrolled and attending secondary education, and is a work light. This light work should consist of simple tasks and is not likely to adversely affect the physical integrity, safety and health, school attendance, or their, moral, psychological, intellectual and cultural physical well-being. (Art.le 66-83 of the Labour Code) 2009. Portugal has ratified Minimum Age Convention (1973) C138 in 1989th and the convention C182 Worst Forms of Child Labour Convention (1999) on 2000th. International Trade Union Confederation (IUTC) ranks 139 countries against 97 internationally recognised indicators to assess where workers' rights are best protected, in law and in practice. Portugal has a rating of 3, from 1 to 5+, in the ITUC Global Rights Index 2014. This score is given for countries where: (There are) 'Regular violation of rights. The government and/or companies are regularly interfering in collective labour rights. There are deficiencies in laws and/or certain practices which make frequent violations possible.' UNICEF report 2012 'Measuring Child Poverty was rating 14,7% of Portuguese children below 16 years age as below 'poverty line'. Robust data about child labour are not recent, as the last official inquiry report is from 2001, and the results were not positive as 4,1% of children of the study were affected by child labour (CNAsti), with half of this proportion related to agriculture. 2015: FSC Portugal CNRA report states 'Despite evidence of some (remaining) cases of child labour, there is evidence that this problem is not structural nor of large size. No evidence found of cases of child labour in the forest sector. The national CWRA explicitly mentions 'child labour in the forest sector in Portugal is very low'. There is evidence that the number of minors working illegally is rather insignificant. Authority directly involved on employment rights and conditions is Work Conditions Authority (ACT) but for many reasons other authorities are related to the issue, as Immigration and Borders Services (SEF) social security services or even tax services. All of them can make inspections to different issues related to work, with the joining of policies authorities as GNR-Republican National Guard and PSP-Public Security Police. ACT has strategic Plans for Agriculture and Forest activities and also does integrated inspections with Spanish authorities for agriculture and forestry activities. Recently one notice state that ACT bought a drone to help agriculture and forestry inspections. Inspective activities of ACT and SEF result on penalties or suspensions when illegal situations are found. Based on the available information it wasn't found any evidence confirming the existence of risks of child labour in forestry in Portugal.</p>

Risk Rating	Low Risk
Comment or Mitigation Measure	---

	Indicator
2.7.4	The BP has implemented appropriate control systems and procedures for verifying that feedstock is not supplied using labour which is discriminated against in respect of employment and occupation.
Finding	Protection against discrimination in labour is included in Portuguese constitution (Article 55th), and labour code. Portugal has ratified ILO convention about discrimination on work and career C111 (1958) on year 1959th. Also convention about equal remuneration C100 was ratified on year 1966th. Portugal is well positioned at majority of international reports: • Corruption Perception Index scores 63 meaning low perceived level of corruption; • Worldwide

	<p>Governance Indicators (WGI) from 73.3 to 84.13 (1-100points) • The WGI report six aggregate governance indicators for over 200 countries and territories over the period 1996-2014, covering i) Voice and Accountability, ii) Political Stability and Absence of Violence/Terrorism, iii) Government Effectiveness, iv) Regulatory Quality, v) Rule of Law, and vi) Control of Corruption. • Free country on press, net, political rights and civil liberties. On the other side Portugal (including human rights, illegal logging , forest and timber) is not listed in alarming reports or indexes such as: • Committee to Protect Journalists Impunity Index; • Human Rights Watch; • Global Witness • Chatham House • Amnesty International Some observations were found about women discrimination on jobs and remuneration and gender pay gap (see below Direct Request (CEACR) - adopted 2014, published 104th ILC session (2015) Equal Remuneration Convention, 1951 (No. 100) – Portugal). Also discrimination episodes were found against Roma and LGB (see below Amnesty International 2014/2015 report The State of the World’s Human Rights) but not related to work activities. Authority directly involved on employment rights and conditions is Work Conditions Authority (ACT) but for many reasons other authorities are related to the issue, as Immigration and Borders Services (SEF) social security services or even tax services. All of them can make inspections to different issues related to work, with the joining of policies authorities as GNR-Republican National Guard and PSP-Public Security Police. ACT has strategic Plans for Agriculture and Forest activities and also does integrated inspections with Spanish authorities for agriculture and forestry activities. Recently one notice state that ACT bought a drone to help agriculture and forestry inspections. Inspective activities of ACT and SEF result on penalties or suspensions when illegal situations are found. Based on the available information, it wasn’t found any evidence that confirms the existence of risks of discrimination against in respect of employment and occupation in forestry in Portugal.</p>

Risk Rating	Low Risk
Comment or Mitigation Measure	---

	Indicator
2.7.5	The BP has implemented appropriate control systems and procedures for verifying that feedstock is supplied using labour where the pay and employment conditions are fair and meet, or exceed, minimum requirements.
Finding	Minimum wage is included in Portuguese constitution (Article 59th), and labour code. Portugal has ratified ILO convention about minimum wage C131 (1970) on year 1981th. Also convention about salary protection C95 was ratified on year 1981th. Payment and employment conditions are included and are updated on labour code. Authority directly involved on employment conditions is Work Conditions Authority (ACT) but for many reasons other authorities are related to the issue, as Immigration and Borders Services (SEF) social security services or even tax services. All of them can make inspections to different issues related to work, with the joining of policies authorities as GNR-Republican National Guard and PSP-Public Security Police. ACT has strategic Plans for Agriculture and Forest activities and also does integrated inspections with Spanish authorities for agriculture and forestry activities. Recently one notice state that ACT bought a drone to help agriculture and forestry inspections. Inspective activities of ACT and SEF result on penalties or suspensions when illegal situations are found. According to the available information about employment conditions, there is a legal framework in the country, and there are legal authorities to enforce legislation. So it is considered that Portugal has low risk that pay and employment conditions are not fair and doesn't meet, or exceed, minimum requirements.
Means of Verification	Work contracts. Existing legislation. Level of enforcement. Regional, publicly available data from a credible third party. Publicly available information (News and media).

Risk Rating	Low Risk
Comment or Mitigation Measure	---

	Indicator
2.8.1	The BP has implemented appropriate control systems and procedures for verifying that appropriate safeguards are put in place to protect the health and safety of forest workers (CPET S12).
Finding	<p>Reginacork has a rigorous control system and adequate procedures on the health and safety of forest workers. Reginacork (contractually) demands the same from its feedstock suppliers and checks the health safety of harvesting personnel during its monitoring inspections. Portugal has ratified convention ILO 184 on 2012, about agriculture health and safety in agriculture which includes forestry activities with exception of industrial forest harvesting. ILO forestry H & S code includes some of forestry activities on 'high risk operations' such as climbing above 3m, but in Portuguese legislation any forestry activity is included on legal list of 'High Risk Activity'. Work legislation aims to create a safe and healthy work environment at all times in accordance with society's technical and social development. Historically, a risk under this category has been present based on a low level of compliance with the requirements for accreditation and/or professional training. In recent years, many obligations have changed and private entities have started to develop courses for some activities of forest workers (for example for chainsaw, machinery or phytopharmaceuticals users). Legal authority for work health and safety is ACT (Working Conditions Authority), who as an inspective role on the</p>

	<p>ground. ACT promoted the development of the Strategic Action Plan for Agriculture, livestock and Forestry sectors from 2012 to 2015 producing the assessment report for this initiative (see report). From the execution of this plan 6 informative leaflets were produced as well as 8 instruments for the application of the respective law framework (checklists). The plan involved the participation of several social partners as well as public partners which can be consulted in the report. An estimate of 9000 employers and employees were reached throughout the development of this plan as well as 560 associative managers and technicians. The plan also comprised an inspective component materialized on 1700 inspections over 3 years reaching to 10 000 workers. Reginacork have a specialist in hygiene and safety at work. This specialist has a responsibility to evaluate all situations that compromise workers. Also all employees of the company, have annual internal and external training (operations by certified companies) on workers' safety and health. The personal protective equipment is also delivered to all employees and is sensitive. It also has internal and external formations in forestry machinery and works in height. International Trade Union Confederation (IUTC) ranks 139 countries against 97 internationally recognised indicators to assess where workers' rights are best protected, in law and in practice. Portugal has a rating of 3, from 1 to 5+, in the ITUC Global Rights Index 2014. This score is given for countries where: (There are) 'Regular violation of rights. The government and/or companies are regularly interfering in collective labour rights. There are deficiencies in laws and/or certain practices which make frequent violations possible.'</p>
<p>Means of Verification</p>	<p>Reginacork's monitoring procedure includes checklists on feedstock suppliers and harvesting operations. Reginacork ensures: • Accredited professional courses (chainsaws, machinery operator, phytopharmaceuticals applicator) card and/or specific certificates of training sessions. • Records of H& S procedures and Personal Protection Equipment distribution by the organization. • Record of machinery safety tools and equipments on original documental register.</p>

Risk Rating	Specified Risk
Comment or Mitigation Measure	<p>Reginacork has a control system and adequate procedures on the health and safety of forest workers. Reginacork demands the same from its feedstock suppliers and checks the health safety of harvesting personnel during its monitoring inspections. Reginacork checks if the personell is trained and if all safety measures are being respected during forest operations, including the use of PPEs, safety distances, work insurance and aptitude forms. During the feedstock supplier's inspections of Reginacork are checked: the training records, workforce, and the hiring of specialists in forest security. Protective equipment (according to the applicable law) and knowledge of personnel is inspected during site visits. In order to mitigate the risk in this indicator, the biomass producer should have proper means to control if workers have the proper training and if all safety measures are being respect during forest operations, including the use of PPEs, safety distances, work insurance and aptitude forms. Reginacork ensures:</p> <ul style="list-style-type: none"> • Accredited professional courses and/or specific certificates of training sessions. • Records of H&S procedures and Personal Protection Equipment distribution by the organization. • Record of machinery safety tools and equipments on original documental register.

	Indicator
2.9.1	Feedstock is not sourced from areas that had high carbon stocks in January 2008 and no longer have those high carbon stocks.
Finding	<p>There is a specified risk of reducing high carbon stocks, but it is not a high one, and by addressing sustainable forest management and the above-mentioned indicators and risks, this indicator is adequately addressed. Considering the positive general trend of carbon accumulation by forests in Portugal, this risk has a regional to local (exceptional) character and is more specifically related to the risks mentioned in the following indicators: a. 2.1.3 (land conversion), b. 2.2.2 (degradation of grounds), and c. 2.4.2 (fires and pests). According to the National Inventory Report on Greenhouse Gases 1995-2015 developed by Portuguese Environment Agency (APA), Portuguese forest acted as a carbon sink in the period of the study with a net carbon sequester of 753.2 Gigagrams. The high carbon stocks are considered to be in wetlands, peatlands (no forested areas related) and old mature forests stands. Information regarding wetlands in Portugal states that as usual in the region they are threatened ecosystems even when</p>

	<p>they are protected. Portugal currently has 1.8% of its territory occupied by wetlands, 79% of which is protected by the Ramsar Convention, covering this protection figure of 31 sites (about 132,487 hectares). 82% of habitats related to wetlands are degraded. Epic WebGis Portugal provides geographical information about wetlands. In the revised information one relevant risks is associated to forestry: cutting of riparian vegetation so specified risk needs to be assessed on this issue. Reginacork ensure that feedstock does not come from riparian vegetation in wetlands complies with legislation (felling license) and do not affect to carbon stocks. There is an increase of pine areas around the plant in the last decade (Portuguese Forest Inventory) i.e., around the region where Reginacork operates and its suppliers harvest from, there was an increase of forested areas, both Pine and Eucalyptus. The consumption of Reginacork is mainly of wood from the pine species. Forest fires are a big risk in Portugal, which can have a devastating effect on forest carbon. Thinning activities and use of end of life timber by Reginacork has positive effects on mitigating this risk.</p>
Means of Verification	<p>Evaluation of the risks and possible impacts of harvesting operations' (EoR). Field study suppliers. Maps, WebPages. Regional, publicly available data from a credible third party. The existence of a strong legal framework in the region Felling license.</p>

Risk Rating	Specified Risk
Comment or Mitigation Measure	<p>1) Reginacork studies data (from publicly available information, researches and programs) for its harvesting teams on aspects that can decrease the carbon stock. This information is given to all feedstock suppliers. 2) Feedstock suppliers are trained to recognise areas where carbon stocks have decreased or destroyed. 3) The harvesting teams inspect visually the plot and make photos on for example recent degradation of lands and indicates the future use of the land (conversion). Reginacork demands a field study from all feedstock suppliers, which includes this point. 4) Reginacork checks plots and the submitted Field Studies. Forests owners can choose to start an orchard, governments can decide to extend the area of urban lands. This occurs regularly in</p>

	<p>Portugal. When forests are converted to other land use the carbon stock is lost. The conversion of forests to urban use is significant (28 thousand ha). In total, the forest area decreased by 150 611 ha, 85% of these forest lands were converted to 'weeds and pastures' (between 1995 and 2010, according to the ICNF). One of the 5 principles of FSC Controlled Wood states that wood from converted land is not acceptable, in practise, however, this point is not evaluated by wood procuring companies, which normally consider all procurements from Portugal at least FSC CW. Extra monitoring is needed on this point. Reginacork does not buy wood from converted lands to be in line with principle 4 of FSC Controlled Wood. FSC CW is the minimal level of wood procurement at Reginacork.</p>

	Indicator
2.9.2	Analysis demonstrates that feedstock harvesting does not diminish the capability of the forest to act as an effective sink or store of carbon over the long term.
Finding	It was found on information reviewed that according to National Inventory (APA, I.P., 2014), from 1990 to 2012 forests are a net carbon sink, with annual sequestration values ranging between -11 MtCO eq and -18 MtCO eq. However on its 2015 report it is stated the negative impact of forest fires (..) Estimates of emissions and sinks from land use change and forestry category show that this category has changed from being a net emitter in 1990 (1.8 Mt CO2 eq.) to a carbon sink in 1992. This situation was again reverted in the years 2003 and 2005 due to the severe forest wildfires events registered in these years. In 2013 this sector represents a sequester of -9.4 Mt CO2e.. Questions regarding forest fires are addressed at indicators 2.4.1 and 2.4.2. Under this information this indicator can be assessed al low risk.
